ABOUT NTIS

NTIS, an agency of the U.S. Department of Commerce, is the central source for the public sale of U.S. Government-sponsored research, development, and engineering reports, as well as foreign technical reports and other analyses prepared by national and local government agencies, their contractors, or grantees. It is the central source for federally generated machine-processable data files, and manages the Federal Software Center for intragovernment distribution. NTIS is one of the world's leading processors of specialty information.

The NTIS information collection exceeds 1.2 million titles, about 200,000 of which contain foreign technology or marketing information. All are permanently available for sale, either directly from the 80,000 titles in shelf stock or from the microfiche masters of titles less in demand. Seventy thousand new reports of completed research are added to the data base annually. In the same period NTIS supplies its customers with more than 6 million documents and microforms. It ships about 23,500 information products daily.

Full summaries of current U.S. and foreign research reports and other specialized information, in hundreds of subject categories, are published regularly by NTIS in a wide variety of weekly newsletters, a biweekly journal, an annual index, and in various subscription formats for other Federal agencies. The complete texts of the reports cited are sold in paper and microform.

Anyone seeking the latest technical reports or wanting to compile unique subject groups of abstracts may search the NTIS Bibliographic Data Base online, using the services of organizations that maintain the data base for public use through contractual relationships with NTIS. Or, the whole data base may be leased in machine-readable form directly from NTIS. The more timely abstracts are continually grouped by NTIS into paperbound "Published Searches," covering over 4,000 topical subject areas.

Customers with well-defined continuing interests subscribe to a standing order microfiche service (SRIM) which enables them automatically to receive the full texts of only those documents relating to their individual requirements. A similar service provides the automatic distribution of paperbound reports.

NTIS sells its technical information products and services under the provisions of Title 15 of the U.S. Code (1151-7). The law establishes a clearinghouse for scientific, technical, and engineering information and directs NTIS to be self-supporting.

NTIS, therefore, is a unique Government agency sustained only by its customers. It operates very much as a business, but in the public service. All the costs of NTIS products and services, including rent, telephone, salaries, marketing, postage, and all other usual costs of doing business are paid from sales income, not from tax-supported congressional appropriations.

HOW TO ORDER

Availability

NTIS announces reports supplied from many sources; copies of most items, but not all, are available from NTIS. Some reports must be obtained from other sources and those are noted.

In the Reports Announcements section (the first section of GRA&I), each bibliographic entry shows where the document may be obtained. NTIS shows such information in two places in its citations—a short, primary entry on the first line of the citation to the right of the NTIS order number, and a secondary entry that immediately precedes the abstract.

Reports available from NTIS have various price codes, actual prices, or the word "Subscription" printed in the primary availability statement. Reports not available from NTIS have the words "Not Available NTIS" printed there.

Not Available NTIS

To find where to order reports listed as "Not Available NTIS," look to the entry just before the abstract for the secondary availability statement. There are a variety of statements on availability varying from an entry that tells where the report was published to specific ordering instructions such as "Paper copy available from ERIC Document Reproduction Service." When NTIS can supply specific ordering instructions, it does so. However, when such information is not available to NTIS, contact your local librarian, who may be able to help you.

Paper and Microfiche Copies

If the primary availability statement has a price code entry such as "PC AO4/MF AO1," you can place your order directly with NTIS. A report may be available in paper copy (PC) or microfiche (MF) or both; if both forms are available, price codes will be given for both PC and MF. To determine the current price, consult the price-code table printed on the outside back cover of the most current issue of GRA&I. Then, please use the order form bound into GRA&I, or a copy, to place your order. Be sure to include the NTIS order

number, the quantity, form, and the order fulfillment options you want—eg, magnetic tape mode.

Other Microforms and Subscriptions

If the report is offered on a subscription basis, or as 16 or 35mm microfilm, the secondary availability statement will so indicate. You may need to write or telephone NTIS for specific instructions on ordering such material; if you have any questions, please write or telephone for clarification (703-487-4630).

Order Fulfillment Options

NTIS offers three order fulfillment options; REGULAR, PREMIUM, and RUSH. If you need assistance with your order, NTIS offers an identification service for NTIS order numbers, prices, and availability. To expedite the identification service, a telephone answering device is used (703-487-4780). Your recorded questions are answered by mail the following working day.

Regular Service. Your order can be placed by mail, by telephone, or in person at one of our sales desks. Current U.S. Postal Service parcel post delivery time is from 9 to 30 days. You can request delivery by first class mail (surcharge of $3 for each copy ordered to North American Continent addresses) or, if you are not a North American Continent customer, you may request foreign airmail (surcharge of $5 per copy ordered). You may elect to pick up at the NTIS Springfield sales desk (5285 Port Royal Road, Springfield, VA 22161, telephone 703-487-4650) or at the NTIS District of Columbia sales desk (Suite 620, 425 Thirteenth St., N.W., Washington, D.C. 20004, telephone 202-724-3382). If you elect personal pickup, the receptionist will call you when your order is ready. Some items cannot be picked up in person, and you will be so notified when you place your order.

Premium Service. This service is available only to NTIS Deposit Account customers. This service uses first class mail delivery (rather than fourth class) to expedite delivery. The surcharge is $3.50 for each copy ordered; for example, if you order three copies of one report or one copy each of three reports, the surcharge in either case would be $10.50. All Deposit Account customers receive a Premium Service ID number that they can use to place telephone orders, using a Western Union 24-hour toll-free number.

Rush Handling. NTIS fills these orders within eight working hours of receipt; no mail orders for rush handling are accepted. Your order can be placed using NTIS's toll-free number (800-336-4700), or by telegram, by Telex (89-9405), by Telecopier (703-321-8547); or in person at one of NTIS sales desks. Orders for mail delivery (by First Class Special Delivery) are accepted only from customers having NTIS Deposit Accounts, American Express, Master Card, or Visa accounts; the surcharge is $10 for each copy ordered. If the order is for personal pickup at one of NTIS's sales desks, the surcharge is $6 for each copy ordered. This service guarantees that your order receives immediate validation, verification of availability, and individual hand processing through inventory control and the warehouse, and priority printing if reproduction from film is required.

Ordering From Outside the United States. To better serve overseas clients NTIS has more than 30 organizations around the world which provide local access to NTIS products and services. These agencies are equipped to handle all inquiries concerning services provided by NTIS. For a list of these agencies, please refer to the inside back cover.

HOW TO USE GOVERNMENT REPORTS ANNOUNCEMENTS & INDEXES

NTIS®

Arrangement of Citations

Bibliographic entries in this journal are arranged by COSATI* classification. This scheme uses 22 broad subject categories which are further separated into 178 subcategories. A bibliographic record is listed in one subcategory only. There are no cross references except in the indexes. Within a subcategory, entries are listed alphanumerically by the NTIS order number.

Access Points

There are several ways to determine where a particular topic or citation is in GRA & I. The titles of the broad subject categories are listed on the back cover, with an edge index to the journal location. Also, subject category and subcategory titles are used as running heads on each page of the Reports Announcement section of the journal. Specific citations can be located by searching the indexes by keyword, personal author name, corporate author name, contract number, grant number, report number, or NTIS order number. The page number of the main entry in the Reports Announcement section is given with each index entry.

* Committee on Scientific and Technical Information

NTIS SUBJECT CATEGORY AND SUBCATEGORY STRUCTURE

NTIS®

You can use the Edge Index on the outside back cover to locate the beginning of each category within the Reports Announcements section.

Category 1. Aeronautics

Subcategories: Aerodynamics; Aeronatuics; Aircraft; Aircraft Flight Control and Instrumentation; Air Facilities.

Category 2. Agriculture

Subcategories:Agricultural Chemistry; Agricultural Economics; Agricultural Engineering; Agronomy and Horticulture; Animal Husbandry; Forestry.

Category 3. Astronomy and Astrophysics

Subcategories: Astronomy; Astrophysics; Celestial Mechanics.

Category 4. Atmoshpheric Sciences

Subcategories: Atmospheric Physics; Meteorology.

Category 5. Behavioral and Social Sciences

Subcategories: Administration and Management; Documentation and Information Technology; Economics; History, Law and Political Science; Human Factors Engineering; Humanities; Linguistics; Man-machine Relations; Personnel Selection, Training and Evaluation; Psychology (Individual and Group Behavior); Sociology.

Category 6. Biological and Medical Sciences

Subcategories: Biochemistry; Bioengineering; Biology; Bionics; Clinical Medicine; Environmental Biology; Escape, Rescue, and Survival; Food, Hygiene, and Sanitiation; Industrial (Occupational) Medicine; Life Support; Medical and Hospital Equipment; Microbiology; Personnel Selection and Maintenance (Medical); Pharmacology; Physiology; Protective Equipment; Radiobiology; Stress Physiology; Toxicology; Weapon Effects.

Category 7. Chemistry

Subcategories: Chemical Engineering; Inorganic Chemistry; Organic Chemistry; Physical Chemistry, Radio and Radiation Chemistry.

Category 8. Earth Sciences and Oceanography

Subcategories: Biological Oceanography; Cartography; Dynamic Oceanography; Geochemistry; Geodesy; Geography; Geology and Mineralogy; Hydrology and Limnology; Mining Engineering; Physical Oceanography; Seismology; Snow, Ice, and Permafrost; Soil Mechanics; Terrestrial Magnetism.

Category 9. Electronics and Electrical Engineering

Subcategories: Components; Computer; Electronic and Electrical Engineering; Information Theory; Subsystems; and Telemetry.

Category 10. Energy Conversion (Non-propulsive)

Subcategories: Conversion Techniques; Power Sources; Energy Storage.

Category 11. Materials

Subcategories: Adhesives and Seals; Ceramics, Refractories,and Glasses; Coatings, Colorants, and Finishes; Composite Materials; Fibers and Textities; Metallurgy and Metallography; Miscellaneous Materials; Oils, Lubricants, and Hydrautic Fluids; Plastics; Rubbers; Solvents, Cleaners, and Abrasives; Wood and Paper Products.

Category 12. Mathematical Sciences

Subcategories: Mathematics and Statistics; Operations Research.

Category 13. Mechanical, Industrial, Civil, and Marine Engineering

Subcategories: Air Conditioning, Heating, Lighting, and Ventilation; Civil Engineering; Construction Equipment, Materials, and Supplies; Containers and Packaging; Couplings, Fittings, Fasteners, and Joints; Ground Transportation Equipment; Hydraulic and Pneumatic Equipment; industrial Processes; Machinery and Tools; Marine Engineering; Pumps, Filters, Pipes, Fittings, Tubing, and Valves; Safety Engineering; Structural Engineering.

Category 14. Methods and Equipment

Subcategories: Cost Effectiveness; Laboratories, Test Facilities, and Test Equipment; Recording Devices; Reliability; Reprography.

Category 15. Military Sciences

Subcategories: Antisubmarine Warfare; Chemical, Biological, and Radiological Warfare; Defense; Intelligence; Logistics; Nuclear Warfare; Operations, Strategy, and Tactics.

Category 16. Missile Technology

Subcategories: Missile Launching and Ground Support; Missile Trajectories; Missile Warheads and Fuses; Missiles

Category 17. Navigation, Communications, Detection, and Countermeasures

Subcategories: Acoustic Detection; Communications; Direction Finding; Electromagnetic and Acoustic Countermeasures; Infrared and Ultraviolet Detection; Magnetic Detection; Navigation and Guidance; Optical Detection; Radar Detection; Seismic Detection.

Category 18. Nuclear Science and Technology

Subcategories: Fusion Devices (Thermonuclear); Isotopes; Nuclear Explosions; Nuclear Instrumentation; Nuclear Power Plants; Radiation Shielding and Protection; Radioactive Wastes and Fission Products; Radioactivity; Reactor Engineering and Operation; Reactor Materials; Reactor Physics; Reactors (Power); Reactors (Non-power); SNAP Technology.

Category 19. Ordnance

Subcategories: Ammunition, Explosives, and Pyrotechnics; Bombs; Combat Vehicles; Explosions, Ballistics, and Armor; Fire Control and Bombing Systems; Guns; Rockets; Underwater Ordnance.

Category 20. Physics

Subcategories: Acoustics; Crystallography; Electricity and Magnetism; Fluid Mechanics; Masers and Lasers; Optics; Particle Accelerators; Particle Physics; Plasma Physics; Quantum Theory; Solid Mechanics; Solid-state Physics; Thermodynamics; Wave Propagation.

Category 21. Propulsion and Fuels

Subcategories: Air-breathing Engines; Combustion and Ignition; Electric Propulsion; Fuels; Jet and Gas Turbine Engines; Nuclear Propulsion; Reciprocating Engines; Rocket Motors and Engines; Rocket Propellants.

Category 22. Space Technology

Subcategories: Astronautics; Spacecraft; Spacecraft Trajectories and Reentry; Spacecraft Launch Vehicles and Ground Support.

This categorization scheme is the one endorsed in 1964 by the Committee on Scientific & Technical Information (Cosati) of the Federal Council for Science & Technology. A booklet describing these categories is available from NTIS; the NTIS order number is AD-612 200, the price codes are PC AO4/MF AO1.

ABOUT ABSTRACT NEWSLETTERS

Abstract Newsletters announce in 26 subject categories summaries of most unclassified federally funded research as it is completed and made available to the public. Abstracts of reports appear in as many categories as appropriate, and do so within a few weeks of their receipt from the originating agencies. Generally, the technical report summaries have been prepared by the author. The final issue of the year is a subject index containing up to 10 subject postings and an NTIS Order/Report Number index. The titles of newsletters available on subscription are:

- Administration & Management
- Agriculture & Food
- Behavior & Society
- Biomedical Technology & Human Factors Engineering
- Building Industry Technology
- Business & Economics
- Chemistry
- Civil Engineering
- Communication
- Computers, Control & Information Theory
- Electrotechnology
- Energy
- Environmental Pollution & Control
- Government Inventions for Licensing
- Health Planning & Health Services Research
- Industrial & Mechanical Engineering
- Library & Information Sciences
- Materials Sciences
- Medicine & Biology
- NASA Earth Resources Survey Program (monthly)
- Natural Resources & Earth Sciences
- Ocean Technology & Engineering
- Physics
- Problem-Solving Information for State & Local Governments
- Transportation
- Urban & Regional Technology & Development

All are weekly publications except where noted. For a price list and sample copies please write to Subscriptions, NTIS, Springfield, VA 22161.

ABOUT SRIM

SRIM (Selected Research in Microfiche) is an automatic biweekly service available from NTIS to help you expand your coverage of U.S. Government research and development at a cost within reach of a modest information budget. You limit your expense by receiving complete research reports (not just abstracts) in microfiche, but only in the subject areas you select. You get the reports in microfiche without having to track down a specific report and order it. For full control of your SRIM collection, you can order the quarterly index service (cumulated annually). For further details, telephone SRIM information (703) 487-4640 or write to NTIS.

ABOUT PUBLISHED SEARCHES

Published Searches are bibliographies, with abstracts, prepared in anticipation of users' needs. The NTIS Bibliographic Data File, as well as international databases covering subjects from food sciences to pollution to management, is the source for the bibliographies. To get a copy of the Catalog of Current Published Searches, listing the more than 4,000 bibliographies available, send $5 to NTIS and ask for PB82-105024. The price of the catalog will be deducted from the cost of your first Published Search. Or, write for one or two of the nine new FREE mini-catalogs, listing available Published Search titles by subject categories:

- Communication and Electrotechnology
- Energy
- Computers
- Agriculture and Food
- Engineering
- Business and Management
- Environment
- Health and Medicine
- Physical Sciences

ABOUT PRODUCT FORMATS

Products listed in GRA&I are available in a variety of formats.
Paper copy (PC)—copies or reprints of the original report.
Microfiche (MF)—105 x 148.57mm microfiche sheets (about 4 x 6 inches), 24X.
Microfilm—16mm.
Microfilm—35mm.
Magnetic tape—7- or 9-track recording modes.

The full bibliographic report entries in this section are arranged by subject category and subcategory. Within each subcategory the reports are arranged alphanumerically by NTIS order number; the Ebcdic character set sort is used.

Computation of Hankel Transforms Using the Fast-Fourier Transform Algorithm,
E. Kausel, and G. Bouckovalas. Aug 79, 49p
R79-12, NSF/RA-79-12, NSF/RA-790206
Grant NSF-ENV77-18339

An efficient numerical procedure is presented for the computation of Hankel Transforms. The algorithm is based on the expression of the Hankel Transform in terms of a two-dimensional Fourier Transform, which is then reduced to only one dimension. The latter is then evaluated with the Fast Fourier Transform algorithm. Examples are presented, and a listing of the computer program included.

Abstract

1. AERONAUTICS

CONF-7810153- PC **A06**/MF **A01**
Activities at Argonne National Laboratory in Evaluating the Potential Toxicity of Effluents from Fluidized Bed Combustion of Coal. Appendix 1.
Aug 79,
Conference on fire particulate emmissions form fluid bed and conventional combustions, Washington, DC, USA, 23 Oct 1978.

It is concluded that: the effluent stream from the ANL PFBC contains appreciable quantities of mutagenic/cytotoxic organic materials. Much of this organic material is sufficiently volatile that it passes through the final filter which operates at a temperature of 150 to 170 exp 0 C. If this effluent stream were vented to the atmosphere at a temperature of approx. 150 exp 0 C (as typically occurs in coal burning power stations), the organic component could be expected to adsorb to the surfaces of the accompanying particulate material. This could, potentially, have a significant effect on the toxicity/carcinogenicity of the effluent. A portion of these mutagenic/cytotoxic materials are solubilized by proteins (e.g., serum). This observation is significant in assessments of potential toxicity of inhaled/ingested materials. The mutagenicity of the organic component of the effluent resides largely in the more polar fractions. The ANL bench-scale PFBC is probably not directly scalable to larger units. These data were collected from samples obtained with the PFBC operating under well-defined conditions. There is not yet sufficient information, however, to determine the effect that changing process conditions may have on the compostion/mutagenicity/cytotoxicity of the effluent stream. (ERA citation 04:054102)

A Technical Assessment of Aeronautical Engineering in Israel.
Technical rept.,
Joseph A. Strada. 1 Jul 81, 8p Rept no. ONRL-R-5-81

A variety of Israeli academic and industrial institutions are discussed with an eye toward assessing research

and development activities in aeronautical engineering disciplines. Each institution is described in brief and some of its current research projects are listed. Research in aerodynamics, guidance and control, propulsion and combustion is discussed and industrial product lines are described where appropriate. Some conclusions are drawn in an effort to assess the country's overall capabilities in aeronautical engineering. (Author)

Prediction of Aerodynamic Forces on a Circular Cylinder and a Thin Airfoil in a Transonic Airstream by the Finite Element Method.
Doctoral thesis,
James E. Marsh. 5 Jun 79, 188p AFIT/DS/AA/79M-1, AFIT-CI-79-216D

The finite element method was used to solve the nonlinear, small-disturbance, transonic, velocity-potential equation for problems of steady flow over a circular cylinder and over a thin-airfoil in a uniform steady airstream. The governing differential equation is valid for inviscid, irrotational, isenthropic flow of a perfect gas to include weak shocks providing airflow separation does not occur. For compressible subsonic and transonic flows the nonlinear small-disturbance equation was expressed in iterative form as a sequence of linear equations which was solved iteratively until the difference between two successive solutions became arbitrarily small. For analysis purposes the infinite flowfield was replaced by a finite but sufficiently large domain that was discretized with sector elements for the cylinder problem and rectangular elements for the airfoil problem. Three sub-problems were investigated for the circular cylinder. First, three different types of trial functions were investigated to approximate the solution for the velocity potential function for the case of incompressible flow without circulation. The three trial functions were: (1) a trignometric approximation resulting in a non-conforming element, (2) a bilinear polynomial (conforming element) typical of elements used in finite element analysis, and (3) a rational approximation resulting in a new conforming element. Convergence properties of each element were studied as a function of discretization refinement (element size). The second subproblem for the cylinder was to use the two conforming elements to obtain solutions for incompressible flow with circulation. Superposition was used to split the total problem into two elementary component problems.

A Method of Determining the Turbulent Base Pressure in Uniform and Non-Uniform Supersonic Axisymmetric Flows.
Final rept.,
Thomas J. Mueller, and Lyle D. Kayser. Oct 81, 93p
Rept no. ARBRL-TR-02374

This report describes the base pressure computation procedure and computer program developed at the University of Notre Dame. The computation is valid for supersonic high Reynolds number flow at zero yaw. The computation is started upstream of the afterbody by means of the Method of Characteristics; hence, the effect of boattail, or flare, angle is determined. The effect of forebody shape can be indirectly determined if the external non-uniform Mach number profile is used as input for the start of the characteristics solution. However, the assumption of a uniform external flow generally provides good results. Examples are shown for uniform external flow inputs and for realistic non-uniform initial conditions. Also, results showing the effects of afterbody angle are presented. (Author)

Steady/Oscillatory, Supersonic/Hypersonic Inviscid Flow Past Oscillating Wings and Wedge Combinations at Arbitrary Angles of Attack.
Master's thesis,
Evangelos Vlassios Youroukos. Jun 81, 182p

The perturbation method proposed by Professor Hui is described. The method gives exact solutions for the perturbed flow over both sides of a flat plate which is oscillating with small amplitude and frequency at large angles of attack in steady supersonic/hypersonic inviscid flow provided that the shock remains attached. Using the strip theory concepts these solutions are extended to study the dynamic stability in pitch of a flat, periodically oscillating wing arbitrary planform shape, at large angles of attack. Finally, Hui's perturbation method is extended on a stationary wedge. (Author)

Wind-Tunnel Results for a Modified 17-Percent-Thick Low-Speed Airfoil Section.
R. J. Mcghee, and W. D. Beasley. Nov 81, 87p
NASA-TP-1919, L-14666

Wind-tunnel tests were conducted in the Langley low-turbulence pressure tunnel to evaluate the effects on performance of modifying a 17-percent-thick low-speed airfoil. The airfoil contour was altered to reduce the pitching-moment coefficient by increasing the forward loading and to increase the climb lift-drag ratio by decreasing the aft upper surface pressure gradient. The tests were conducted over a Mach number range from 0.07 to 0.32, a chord Reynolds number range 1.0 x 10 to the 6th power to 12.0 x 10 to the 6th power, and an angle-of-attack range from about -10 deg to 20 deg.

A Study on Numerical Method for Evaluating Spanwise Integral in Subsonic Lifting-Surface Theory.
T. Ichikawa. Mar 81, 22p NAL-TR-661T, ISSN-3989-4010

Two disputable points are discussed. The first point is the coincidence of each collocation section with one of the spanwise integration points. The second point is the relatively small, but undesirable, sharp variation of the regularized influence functions near the collocation sections. Two proposals for coping with these difficulties are made. Their effects are examined by computing the downwash at the surface of a steady rectangular wing subjected to a simple wing loading. It is shown that method 1, which avoids the coincidence, makes it possible, with no losses in accuracy, to greatly reduce the computing time in cases of oscillating wings. Further, it is shown that remarkable improvement in convergence with respect to the number of spanwise integration points is obtained by method 2 which distributes the spanwise integration points densely only near the collocation sections.

College of Aeronautics, Cranfield (England).
A Wake Source Model for Non-Symmetric Flow past Bluff Bodies in Two-Dimensional Flow.
P. A. T. Christopher, and I. Wolton. Sep 81, 37p C-OF-A-MEMO-8109

The Parkinson and Jandali model was extended to the case where the bluff body and its wake are not symmetric with respect to the incident flow. In the case of flat plates good agreement with experiment is obtained. With a cylinder of square section agreement is good at low incidence, but at higher incidences the position of the stagnation point is less accurately predicted and there is an associated distortion of the pressure distribution.

Aircraft Wing Trailing-Edge Noise.
R. L. Underwood, and T. H. Hodgson. 1981, 145p
NASA-CR-164952
Grant NSG-1377

The mechanism and sound pressure level of the trailing-edge noise for two-dimensional turbulent boundary layer flow was examined. Experiment is compared with current theory. A NACA 0012 airfoil of 0.61 m chord and 0.46 m span was immersed in the laminar flow of a low turbulence open jet. A 2.54 cm width roughness strip was placed at 15 percent chord from the leading edge on both sides of the airfoil as a boundary layer trip so that two separate but statistically equivalent turbulent boundary layers were formed. Tests were performed with several trailing-edge geometries with the upstream velocity U sub infinity ranging from a value of 30.9 m/s up to 73.4 m/s. Properties of the boundary layer for the airfoil and pressure fluctuations in the vicinity of the trailing-edge were examined. A scattered pressure field due to the presence of the trailing-edge was observed and is suggested as a possible sound producing mechanism for the trailing-edge noise.

Vibrational Analysis in Aerodynamics. 1972-1981 (Citations from the International Aerospace Abstracts Data Base).
Rept. for Jan 72-Dec 81.
Dec 81, 137p
Supersedes PB81-853947. Prepared in cooperation with the National Aeronautics and Space Administration, Washington, DC.

This bibliography contains citations concerned with design and performance relative to aerodynamic vibration. Among the topics discussed are torsion blade flutter; vibration generated by rudders, rotor blades, panels, air foils; vortex shedding; load control; and helicopter gust response flutter. Aircraft vibrational analyses by means of analog computer simulation, autoflight control systems, and structural dynamics of aircraft are included with consideration for flight vehicle vibration control and reduction. (This updated bibliography contains 127 citations, 11 of which are new entries to the previous edition.)

PB82-858549 PC **N01**/MF **N01**
National Technical Information Service, Springfield, VA.
Vibrational Analysis in Aerodynamics. 1970-1981 (Citations from the Engineering Index Data Base).
Rept. for Jan 70-Dec 81.
Dec 81, 97p
Supersedes PB81-853939.

Reports are cited which discuss aerodynamic aircraft and spacecraft generated vibration. Structural design flutter in air-cushion vehicles; helicopter blade flutter; steady lift wing flutter; bending-torsion flutter at supersonic, subsonic and transonic speeds; wake-induced wing flutter; stalled and unstalled flutter, and panel flutter are among the conditions discussed relative to such analysis techniques as finite element analysis. Ground vibration test results, space vehicle automated design, and calculation of critical flutter speeds for fixed-wing aircraft are included with respect to vibrational suppression performance. (This updated bibliography contains 94 citations, 16 of which are new entries to the previous edition.)

Vibrational Analysis in Aerodynamics. 1970-1981 (Citations from the NTIS Data Base).
Rept. for Jan 70-Dec 81.
Dec 81, 218p
Supersedes PB81-853921.

This bibliography cites reports on excitation and analysis techniques for flight flutter tests. Although fixed-wing aircraft, space flight vehicles, VTOL and V/STOL vehicles are included, helicopter generated vibration analysis is emphasized in this bibliography. Among the variations of flutter included are unsteady airloads, fluidelastic vibration, rotor blade in forward flight, turbomachine blades, composite wings, response of reentry vehicles, tail vibration, hingeless helicopter rotors and hinge-type, propeller whirl and SST related vibration. Analysis by aeroelastic and dynamic finite element techniques and collocation methods by computer analysis are included relative to dynamic structural damping and computer graphics in aeronautical engineering to suppress aircraft and spacecraft vibration. (This updated bibliography contains 169 citations, 33 of which are new entries to the previous edition.)

Algorithm for Fuel Conservative Horizontal Capture Trajectories.
F. Neuman, and H. Erzberger. Oct 81, 31p NASA-TM-81334, A-8746

A real time algorithm for computing constant altitude fuel-conservative approach trajectories for aircraft is described. The characteristics of the trajectory computed were chosen to approximate the extremal trajec-

tories obtained from the optimal control solution to the problem and showed a fuel difference of only 0.5 to 2 percent for the real time algorithm in favor of the extremals. The trajectories may start at any initial position, heading, and speed and end at any other final position, heading, and speed. They consist of straight lines and a series of circular arcs of varying radius to approximate constant bank-angle decelerating turns. Throttle control is maximum thrust, nominal thrust, or zero thrust. Bank-angle control is either zero or aproximately 30 deg.

Wind Tunnel Test of a Self-Optimizing Flexible Technology Wing.
Final rept. 4 Sep-22 Nov 79,
D. A. MacLanahan, Jr. Jan 80, 24p Rept no. AEDC-TSR-80-P3
Prepared in cooperation with ARO, Inc., Tullahoma, TN.

A 1/6-scale, semispan model of an AFTI-111 concept equipped with eleven remotely controllable hydraulic actuation systems used to control wing shape and horizontal tail angle was tested in the Propulsion Wind Tunnel (16T) at free-stream Mach numbers of 0.60 and 0.85 and free-stream dynamic pressures of 400 and 500 psf. Angle of attack was varied from 0 to 8 deg. The objectives of this test were to further develop and refine a computer-controlled self-optimizing wing for continual investigation of optimum wing airfoil contours for specific mission profiles. A Study of Wall Jets and Tangentially Blown Wings.
Final rept. 1 Jan 76-31 Mar 81,
N. D. Malmuth, W. D. Murphy, and J. D. Cole. Jul 81, 177p Rept no. SC5055.21FR
Contract N00014-76-C-0350
Prepared in cooperation with California Univ., Los Angeles.

A study of transonic wall jets and tangentially blown wings has been performed by using asymptotic and computational methods. For the portion of the effort dealing with wall jets, both submerged and coflowing cases have been investigated. For the submerged configurations, the nature of the decay process for disturbances emanating from the jet exit has been examined. In this analysis, the Kutta condition on the nozzle rim can be satisfied merely by requiring streamwise continuity of the potential across the rim as a trailing edge for the flow. With this model, the slip line boundaries create an exponential damped sinusoidal relaxation of the disturbances as compared to algebraic decay for analogous unconfined flows. A similar observation applies to wind tunnel far fields. The nonlinear case differs from the linear one in that the amplitude of the downstream propagated disturbance interacts nonlinearly with the near field in the former case. For these wall jets, acceleration to criticality is accomplished by stream tube contractions and throats induced by upstream influence of the turning. In the coflowing case. selection rules defining various jet flow regimes in terms of the jet transonic similarity parameter and pressure level are given. Conditions are prescribed which define the penetration length for supersonic disturbances downstream from the exit as well as the location of the throats in the jet. The critically of the flow far downstream is also quantified in terms of these parameters.

Some Unique Applications for Tethered Balloon Systems,
Catherine L. Rice, Arthur O. Korn, George H. McPhetres, and F. V. Hunsinger. 5 Nov 81, 7p Rept no. AFGL-TR-81-0297
Presented at the AIAA Aerodynamic Decelerator and Balloon Technology Conference (7th), 20-23 Oct 81, San Diego, CA., Paper AIAA 81-1916.

Properly designed tethered balloon systems are remarkably versatile test platforms. They can be erected quickly, to great heights and provide unobstructed viewing. This paper describes several systems designed and operated by the Air Force Geophysics Laboratory: a dual array to erect and recover a 1000-ft square flexible net with carbon fiber collectors; a single tether supporting sensors along its length for boundary layer measurements; a tritethered emergency substitute for a LORAN antenna; and tritethers for weapons evaluation and for tests of the Surveyor moon lander.

AGARD Flight Test Instrumentation Series. Volume 13. Practical Aspects of Instrumentation System Installation,
Robert W. Borek. Sep 81, 199p Rept no. AGARD-AG-160-VOL-13
See also Volume 12, AD-A097 225.

This AGARDograph is the 13th of the AGARD Flight Test Instrumentation Series and outlines some of the factors that influence the development of an instrumentation system installation. The volume was not written with the intention of being a design handbook and therefore the guidelines presented are in most cases given as suggestions. The material is presented in a progressive manner starting with a review of the mission profile requirements. Included are such factors as environment, reliability and maintainability, and system safety. The assessment of the mission profile is followed by an overview of electrical and mechanical installation factors. The material presented is primarily directed at shock/vibration isolation systems and standardization of the electrical wiring installation, two factors often overlooked by instrumentation engineers. A discussion of installation hardware reviews the performance capabilities of wiring, connectors, fuses and circuit breakers, and so forth. Information is provided to guide proper selections. The discussion of the installation is primarily concerned with the electrical wire routing, shield terminations and grounding. Also included are some examples of installation mistakes that could affect system accuracy. The remaining two sections discuss system verification procedures and special considerations such as sneak circuits, pyrotechnics, aircraft antenna patterns, and lightning strikes.

Effects of Vortex Flaps on the Low-Speed Aerodynamic Characteristics of an Arrow Wing.
L. P. Yip, and D. G. Murri. Nov 81, 64p NASA-TP-1914, L-14575

Tests were conducted in the Langley 12-foot low-speed wind-tunnel to determine the longitudinal and lateral-directional aerodynamic effects of plain and tabbed vortex flaps on a flat-plate, highly swept arrow-wing model. Flow-visualization studies were made using a helium-bubble technique. Static forces and moments were measured over an angle-of-attack range from 0 deg to 50deg for sideslip angles of 0 deg and + or - 4 deg.

New Estimation Method for Flutter or Divergence Boundary from Random Responses at Subcritical Speeds.
Y. Matsuzaki, and Y. Ando. Apr 81, 15p NAL-TR-667T, ISSN-0389-4-10

A new technique for estimating the flutter or divergence boundary from responses due to turbulence at subcritical speeds is described. The boundary can be predicted without estimating or measuring the dampings and frequencies of the aeroelastic modes. The sampled time response is modeled by the mixed autoregressive moving average process. The orders and coefficients of both autogressive and moving average parts of the process are determined with the aid of Akaike's estimation procedure. The stability boundary is estimated by using Jury's stability determinants which are expressed in terms of the autogressive coefficients alone. The modal frequencies and dampings are also evaluated from the coefficients. The technique proposed has been applied with success to signals from a cantilever wing model tested in a low supersonic flow. Comparison between the actual and estimated flutter boundaries shows that an accurate estimation can be made from data obtained in a narrow range of the dynamic pressure which is sufficiently below the boundary.

Low Speed Testing of the Inlets Designed for a Tamden-Fan V/STOL Nacelle.
R. C. Williams, and A. H. Ybarra. 1981, 13p NASA-TM-82728, E-1031
Presented at the V/STOL Conf., Palo Alto, Calif., 7-9 Dec. 1981.

An approximately 0.25 scale model of a tandem fan nacelle, designed for a subsonic V/STOL aircraft, was tested in a Lewis wind tunnel. Model variables included long and short aft inlet cowls and the addition of exterior strakes to the short inlet cowl. Inlet pressure recoveries and distortion were measured at pitch angles to 40 deg and at combinations of pitch and yaw to 30 deg. Airspeeds covered a range to 135 knots (69 m/sec). The short aft inlet with added strakes had the best aerodynamic performance and is considered suitable for the intended V/STOL application.

Parametric Study of Microwave-Powered High-Altitude Airplane Platforms Designed for Linear Flight.
C. E. K. Morris, Jr. Nov 81, 74p NASA-TP-1918, L-14606

The performance of a class of remotely piloted, microwave powered, high altitude airplane platforms is studied. The first part of each cycle of the flight profile consists of climb while the vehicle is tracked and powered by a microwave beam; this is followed by gliding flight back to a minimum altitude above a microwave station and initiation of another cycle. Parametric variations were used to define the effects of changes in the characteristics of the airplane aerodynamics, the energy transmission systems, the propulsion system, and winds. Results show that wind effects limit the reduction of wing loading and the increase of lift coefficient, two effective ways to obtain longer range and endurance for each flight cycle. Calculated climb performance showed strong sensitivity to some power and propulsion parameters. A simplified method of computing gliding endurance was developed.

Icing Tunnel Tests of a Composite Porous Leading Edge for Use with a Liquid Anti-Ice System.
D. L. Kohlman. Sep 81, 21p NASA-CR-164966, KU-FRL-464-3
Contract NAG3-71

The efficacy of liquid ice protection systems which distribute a glycol-water solution onto leading edge surfaces through a porous skin was demonstrated in tests conducted in the NASA Lewis icing research tunnel using a composite porous leading edge panels. The data obtained were compared with the performance of previously tested stainless steel leading edge with the same geometry. Results show: (1) anti-ice protection of a composite leading edge is possible for all the simulated conditions tested; (2) the glycol flow rates required to achieve anti-ice protection were generally much higher than those required for a stainless steel panel; (3) the low reservoir pressures of the glycol during test runs indicates that more uniform distribution of glycol, and therefore lower glycol flow rates, can probably be achieved by decreasing the porosity of the panel; and (4) significant weight savings can be achieved in fluid ice protection systems with composite porous leading edges. The resistance of composite panels to abrasion and erosion must yet be determined before they can be incorporated in production systems.

A Comparison of Theoretical and Experimental Pressure Distributions for Two Advanced Fighter Wings.
H. P. Haney, and R. M. Hicks. Oct 81, 87p NASA-TM-81331, A-8741

A comparison was made between experimental pressure distributions measured during testing of the Vought A-7 fighter and the theoretical predictions of four transonic potential flow codes. Isolated wind and three wing-body codes were used for comparison. All comparisons are for transonic Mach numbers and include both attached and separate flows. In general, the wing-body codes gave better agreement with the experiment than did the isolated wing code but, because of the greater complexity of the geometry, were found to be considerably more expensive and less reliable.

An Influence Coefficient Method for the Application of the Modal Technique to Wing Flutter Suppression of the Dast Arw-1 Wing.
Final Report.
S. Pines. Nov 81, 49p NASA-CR-165772, AMA-81-25
Contract NAS1-15593

The methods used to compute the mass, structural stiffness, and aerodynamic forces in the form of influence coefficient matrices as applied to a flutter analysis of the Drones for Aerodynamic and Structural Testing (DAST) Aeroelastic Research Wing. The DAST wing was chosen because wind tunnel flutter test data and zero speed vibration data of the modes and frequencies exist and are available for comparison. A derivation of the equations of motion that can be used to apply the modal method for flutter suppression is included. A comparison of the open loop flutter predictions with both wind tunnel data and other analytical methods is presented.

Aeroacoustic Theory for Noncompact Wing-Gust Interaction.
R. Martinez, and S. E. Widnall. Oct 81, 124p FDRL-81-7
Grant NSG-2142

Three aeroacoustic models for noncompact wing-gust interaction were developed for subsonic flow. The first is that for a two dimensional (infinite span) wing passing through an oblique gust. The unsteady pressure field was obtained by the Wiener-Hopf technique; the airfoil loading and the associated acoustic field were calculated, respectively, by allowing the field point down on the airfoil surface, or by letting it go to infinity. The second model is a simple spanwise superposition of two dimensional solutions to account for three dimensional acoustic effects of wing rotation (for a helicopter blade, or some other rotating planform) and of finiteness of wing span. A three dimensional theory for a single gust was applied to calculate the acoustic signature in closed form due to blade vortex interaction in helicopters. The third model is that of a quarter infinite plate with side edge through a gust at high subsonic speed. An approximate solution for the three dimensional loading and the associated three dimensional acoustic field in closed form was obtained. The results reflected the acoustic effect of satisfying the correct loading condition at the side edge.

Amplified Crossflow Disturbances in the Laminar Boundary Layer on Swept Wings with Suction.
J. R. Dagenhart. Nov 81, 90p NASA-TP-1902, L-14423

Solution charts of the Orr-Sommerfeld equation for stationary crossflow disturbances are presented for 10 typical velocity profiles on a swept laminar flow control wing. The critical crossflow Reynolds number is shown to be a function of a boundary layer shape factor. Amplification rates for crosslow disturbaces are shown to be proportional to the maximum crossflow velocity. A computer stability program called MARIA, employing the amplification rate data for the 10 crossflow velocity profiles, is constructed. This code is shown to adequately approximate more involved computer stability codes using less than two percent as much computer time while retaining the essential physical disturbance growth model.

Integrated Analysis of Engine.
C. C. Chamis. 1981, 24p NASA-TM-82713, E-995
Presented at the Ann. Meeting of the Asme, Washington, D.C., 16-21 Nov. 1981.

The need for light, durable, fuel efficient, cost effective aircraft requires the development of engine structures which are flexible, made from advaced materials (including composites), resist higher temperatures, maintain tighter clearances and have lower maintenance costs. The formal quantification of any or several of these requires integrated computer programs (multilevel and/or interdisciplinary analysis programs interconnected) for engine structural analysis/design. Several integrated analysis computer prorams are under development at Lewis Reseach Center. These programs include: (1) COBSTRAN-Composite Blade Structural Analysis, (2) CODSTRAN-Composite Durability Structural Analysis, (3) CISTRAN-Composite Impact Structural Analysis, (4) STAEBL-StruTailoring of Engine Blades, and (5) ESMOSS-Engine Structures Modeling Software System. Three other related programs, developed under Lewis sponsorship, are described.

Helicopter Rotor Trailing Edge Noise.
Final Report.
R. H. Schlinker, and R. K. Amier. Nov 81, 150p NASA-CR-3470
Contract NAS1-15730

A two dimensional section of a helicopter main rotor blade was tested in an acoustic wind tunnel at close to full-scale Reynolds numbers to obtain boundary layer data and acoustic data for use in developing an acoustic scaling law and testing a first principles trailing edge noise theory. Results were extended to the rotating frame coordinate system to develop a helicopter rotor trailing edge noise prediction. Comparisons of the calculated noise levels with helicopter flyover spectra demonstrate that trailing edge noise contributes significantly to the total helicopter noise spectrum at high frequencies. This noise mechanism is expected to control the minimum rotor noise. In the case of noise radiation from a local blade segment, the acoustic directivity pattern is predicted by the first principles trailing edge noise theory. Acoustic spectra are predicted by a scaling law which includes Mach number, boundary layer thickness and observer position. Spectrum shape and sound pressure level are also predicted by the first principles theory but the analysis does not predict the Strouhal value identifying the spectrum peak.

SEL and EPNL Noise Duration Coefficients for the 747 and T-38 Aircraft.
W. L. Willshire, Jr. Sep 81, 12p NASA-TM-83214

Duration coefficient were calculated for Boeing 747 and T-38 airplanes for sound exposure level (SEL) and effective perceived noise level (EPNL) scales. The measured SEL suration coefficients were 8.4 for the Boeing 747 and 5.5 for the T-38 result was in good agreement with a previous result for a similar F-5 airplane. In EPNL, the duration coefficients were 7.2 for the Boeing 747 and 5.7 for the T-38. The difference in the results between the two airplanes is believed to be due to their different engine noise source spectra. The difference in the Boeing 747 results in the two different metric was due to the different frequency weighting of A-weighted sound pressure level, used in SEL, and tone-corrected perceived noise level, used in EPNL, when applied to the 747 spectra.

Theory and Applications of Optimal Control in Aerospace Systems,
Pieter Kant. Jul 81, 286p Rept no. AGARD-AG-251

Modern control theory has for a long time been largely the domain of mathematicians and control theoreticians. Engineering applications were rare and partial, for a part due to the inaccessability of the theory to the practical engineer, but mainly because of the lack of computing power available to process the estimation and control algorithms resulting from the theory. In the course of the sixties and especially in the seventies the digital computer made enormous advances resulting in a reduction in size, power and cost by several magnitudes. Moreover, successful attempts were made to develop efficient algorithms which could be implemented in moderate-size onboard computers. As a result of these developments, realisation of the potential benefits of modern control has come within grasp and several applications in the aerospace field can be witnessed to-day. The present Agardograph is an attempt to present a picture of the advances in modern control as applied to aerospace system design. The Agardograph is divided into three parts. Part one deals

with some basic concepts of control theory, part two contains a number of chapters on practical design techniques developed from the theory, and finally part three describes a number of design examples and practical applications in real systems.

Aircraft Alerting Systems Standardization Study. Volume I. Candidate System Validation and Time-Critical Display Evaluation.
Final rept. Feb-Nov 80 on Phase 3,
G. P. Boucek, D. A. Po-Chedley, B. L. Berson, D. C. Hanson, and M. F. Leffler. Jan 81, 116p FAA/RD-81/38/1
Contract DOT-FA79WA-4268
See also Volume 2, AD-A106 732. Original contains color plates: All DTIC and NTIS reproduction will be in black and white. Prepared in cooperation with McDonnell Douglas and Lockheed.

This report is one of a series of documented studies directed to the improvement and standardization of aircraft alerting systems. The purpose of the study was to develop and validate, through simulation, functional design criteria that can be used in designing effective aircraft alerting systems. The major objectives of this phase study were to: resolve system component questions; validate the two candidate system concepts by comparison to a representative baseline system, for both the pilot and flight engineer stations; evaluate presentation media and display formats for time-critical warnings; develop guidelines for the design of alerting systems. The system component questions were resolved in a series of experiments and the results were integrated into two system concepts for validation. In the validation tests, line-qualified pilots exercised the three alerting systems in a full-mission, fixed-base simulator. In all areas of measurement pilot performance was as good or better with the two candidate system designs than with the conventional, baseline system. The results indicate that a flight engineer station should contain the visual display components offered by the candidate system concepts. Voice was the recommended medium of presentation when rapid response is required. The time-critical display tests showed that fastest pilot response performance was obtained when graphic guidance alerts were placed in the pilot's primary field of view. The functional design criteria that were developed are contained in 'Aircraft Alerting System Design Guidelines, ' Report Number DOT/FAA/RD-81/38/11. (Author)

Digital Command Augmentation for Lateral-Directional Aircraft Dynamics.
Master's thesis,
David Atzhorn. May 81, 203p Rept no. AFIT-CI-81-55T

Linear-quadratic sampled-data regulator theory is used to design several Type 0 and Type 1 control laws for lateral-directional aircraft dynamics. Control structures are defined for singular command inputs and for control rate outputs; the former allows for precise following of a command whose integral appears in the state vector, while the latter uses both a difference approximation and the Tustin transform to characterize control rate in the discrete-time domain. Type 0 controllers with control rate restraint and 'equivalent' Type 1 controllers are implemented in a microprocessor-based digital flight control system, and flight tests are conducted using Princeton University's Variable-Response Research Aircraft. The control system, entitled CAS-4, offers four combinations of control: direct (unaugmented) control, Type 0 control with both roll rate/sideslip angle and roll rate/lateral acceleration command combinations, and Type 1 control with roll rate/sideslip angle command. Ground-based hybrid simulation and flight tests results show that major closed-loop response features are unaffected by the choice of sampling rate when sampled-data regulator is used. Consequently, much lower sampling rates than would normally be expected can be used when control laws are derived in this manner (a sampling rate of 10 sps is primarily used in this investigation, though lower sampling rates are investigated as well). The results derived through this investigation and presented herein provide additional evidence that digital flight control through modern control theory will be a practical way of implementing flight control systems in future high performance aircraft.

Alert Aircraft Roll Over Chocks.
Final engineering rept.,
John M. Connolly. 14 Aug 81, 53p Rept no. SAC/LGME-ER-P-372

This is a study of the feasibility of restraining a parked alert aircraft with chocks which could be safely taxied over. Chocks were designed and then evaluated during SAC Giant Match II exercise. The chocks successfully restrained a parked aircraft and allowed a heavy weight aircraft to safely taxi over when the chocks were placed on a rough surface. Roll-over chock use was expanded command wide in 1980 for B-52G and KC-135 alert aircraft except on icy surfaces. Three ice gripping surface designs were evaluated in January 1981. All three designs performed successfully. (Author)

Corps of Engineers' Acquisition of Fish Hatchery Proves Costly.
18 Sep 81, 104p Rept no. GAO/CED-81-109

The price the Corps of Engineers paid to acquire Crystal Springs Ranch fish hatchery in Twin Falls County, Idaho, has been extremely controversial because many people in the area associated with the trout farm industry believe the price was too high. In addition, steelhead trout, which will be raised on the site, could possibly be purchased from commercial hatcheries at a substantial savings to the Government. In view of the controversy surrounding these matters, the Chairman, House Committee on Public Works and Transportation, asked us to review the procedures the Corps used to select the hatchery, the method the appraiser used to arrive at his opinion of the hatchery's fair market value, and the possibility of the Corps providing the fish more economically by contracting with commercial hatcheries. Grain Fumigation: A Multifaceted Issue Needing Coordinated Attention.
10 Sep 81, 25p Rept no. GAO/CED-81-152
Report to the Interagency Regulatory Liaison Group.

Grain fumigation is a broad subject, influencing the efficiency of grain marketing and encompassing environmental, consumer and worker protection, transportation, and food issues. Despite many years of using fumigants to eradicate insect pests from grain and grain products, and despite the involvement of many government agencies in various facets of this activity, fumigant problems remain and much still needs to be learned about fumigants and their effects. Many of the problems and questions about fumigants arise because they are toxic substances and can harm not only insects but humans as well. (Author)

Information on Peanut Allotment Owners that Lease and Rent Away Rather Than Plant Their Peanut Allotments/Quotas.
21 Sep 81, 7p Rept no. GAO/CED-81-156

Section 359(b) of the Agricultural Adjustment Act of 1938, as amended, provides that anyone growing and marketing more than 1 acre of peanuts in the United States without a peanut allotment and quota is subject to a substantial penalty. Allotments have been assigned to individual farms. A person without an original allotment must either inherit, purchase, or rent the farm, or lease the peanut allotment from the farm's owner. Each allotment holder receives, as a farm poundage marketing quota, a proportionate share of the national poundage quota established by the Secretary of Agriculture. In 1981 the national peanut allotment was 1,739,000 acres. There are 16 states with allotments, but 92 percent of the allotments are in just 6 states--Alabama, Georgia. North Carolina, Oklahoma, Texas, and Virginia. When peanuts are grown under lease or rental arrangements, not by the owners of the allotments, the cost of production is increased by the lease/rent cost. According to data obtained by the Department during a 1978 survey, in 1977 this cost

ranged from a low of $31 an acre in Texas to a high of $192 an acre in Georgia.

An Evaluation of the New York Area Sampling Frame.
Staff rept.,
Jeff Geuder. Sep 81, 23p AGES-810929

A new area sampling frame was constructed for New York for use in the 1979 June Enumerative Survey. This paper presents an evaluation of the new frame. Topics examined include frame construction procedures, stratification, and sampling and nonsampling errors. In addition, the old frame is compared to the new. The new frame produced estimates approximately the same precision as the old frame for major crops.

Financial Profile of 15 New Agricultural Marketing Cooperatives,
Ralph W. Dutrow, Philip F. Brown, and Raymond Williams. May 81, 14p ACS/SR-2

Data obtained from the actual operations of recently formed cooperatives was the basis of this study. Fifteen new agricultural marketing cooperatives more than doubled their membership and increased their sales almost 300 percent during the period, about 1968 to 1978. These cooperatives were studied because they successfully survived their initial 5 to 10 years of operation. Banks for Cooperatives were active in providing capital for seasonal and operating purposes but less active in providing long-term loans to these new cooperatives. The original intention was to select a random sample of new cooperatives to be studied; however, because a limited number of new cooperatives are still operating all that could be identified are included in the study. These cooperatives are limited to livestock, grain, or fruit and vegetable marketing; no supply or service cooperatives are included.

Attitudes Toward Cooperatives by Bank Trust and Professional Farm Managers,
Michael S. Hanrahan. Dec 80, 16p ACS-SR-1

This study was conducted through interviews with bank trust departments and professional farm management companies. Farm operators of professional farm management entities (PFMEs) purchase and sell at local dealers and view farmer cooperatives as simply one type of local dealer or outlet. They make few attempts to centralize and pool either purchasing or selling transactions or to bypass local dealers, even when quantity deals are made. Purchase of insurance, however, is usually centralized.

Cooperative Farm Machinery Operations: Oregon and Wisconsin,
Lloyd C. Biser. Apr 81, 13p ACS/SR-3

Oregon and Wisconsin are the two leading States in cooperative sales of heavy and full line farm machinery. A review of operations in both States provides insights into the future of cooperative activity in the machinery area. Cooperatives in Oregon increased farm machinery sales from $4.7 million in 1958 to $31.8 million in 1978. Machinery sales averaged an annual growth rate of 29 percent -- 8 percentage points more than the sales of all products sold by the same cooperatives. Cooperative farm machinery sales in Wisconsin increased from $7.4 million in 1958 to $41.6 million in 1978. This amounted to an average annual machinery growth rate of 23 percent -- 1 percentage point above the cooperatives' growth in total sales.

Vacation Farm Cooperatives,
Abraham Pizam, Laura Richardson, and William Seymour. Jun 81, 22p ACS/SR-5

Modern agriculture has become a complex activity requiring increased technical knowledge and large capital investments. The small farmer who cannot take advantage of the economy of scale has found it difficult to maintain an adequate standard of living or, even in some cases, to remain in farming. More farmers are seeking alternative sources of on-farm income. Increased leisure time among urban people seems to offer these farmers great potential for vacation farming. A vacation farm enterprise is like any other farming operation, with one added 'cash crop', people. The farm family takes in guests, usually city folks, for short lengths of time at moderate cost. Besides the relaxed atmosphere of a farm in the country, the guests may also enjoy swimming, hunting, fishing, hiking, or picnicking.

Risk and Allocative Errors Due to Imperfect Information: The Impact on Wheat Technology in Tunisia.
Doctoral thesis,
David Fergus Nygaard. Dec 79, 147p AID-PN-AAH-602
Contract AID/ta-BMA-5

In the 12 years since high-yield varieties of wheat were introduced in Tunisia, only 15% of all farmers have adopted them. This Ph.D. thesis explains the low adoption rate by analyzing the factors affecting a producer's input decisions (including seed choice), the judgemental errors made in output projections, and the effect of such misjudgements on wheat productivity. The author develops a theoretical model to describe this decisionmaking process. This model incorporates risk and uncertainty variables and notes the difference, or 'allocative error,' between the producer's output expectations - based on input decisions - and the actual outputs.

Wastewater Treatment by a Prototype Slow Rate Land Treatment System,
Thomas F. Jenkins, and Antonio J. Palazzo. Aug 81, 54p Rept no. CRREL-81-14

Six slow rate land treatment prototypes, three containing a Windsor sandy loam and three containing Charlton silt loam, were studied from June 1974-May 1980. The systems were spray irrigated with either primary or secondary wastewater at application rates ranging from 2.5 cm/wk to 15 cm/wk. Application schedules were also varied. The performance of forage grasses was studied to determine the yield and nutrient uptake under the various application regimes. The results indicate that, on a mass basis, an average of 91% of the nitrogen (N) applied could be attributed to either plant uptake or percolation of soluble N, mainly nitrate. Nitrate concentrations in the percolate were found to correlate with N loading rate. An N loading rate of 800 kg/ha resulted in a mean concentration of about 10 mg/L of NO3-N in the percolate. Plant uptake of N was linearly related to N loading rate at loading rates less than 800 kg/ha. In this range, plant uptake accounted for about 60% of the N applied. Mean phosphorus (P) concentrations in the percolate were found to range from 0.03 to 0.07 mg/L P and depended only slightly on application rate. Removal of P averaged greater than 99% for all application regimes. Water balance measurements indicate that evapotranspiration exceeded pan evaporation by a factor ranging from 0.86 to 1.17 over a 6-year period. Treatment of biochemical oxygen demand (BODs), suspended solids, total organic carbon (TOC), and fecal coliform were excellent. Residual levels of BODs, suspended solids, and TOC in the percolate averaged 1.3, 1.2 and 1.8 mg/L, respectively.

Evaluation of Multiband, Multitemporal, and Transformed Landsat Mss Data for Land Cover Area Estimation.
E. R. Stoner, G. A. May, and M. T. Kalcic. Apr 81, 25p E81-10161, NASA-TM-82289
Contract PROJ. AGRISTARS
Sponsored by NASA, Usda, Dept. Of Commerce, Dept. Of the Interior, and Agency for International Development. Erts.

Sample segments of ground-verified land cover data collected in conjunction with the USDA/ESS June Enumerative Survey were merged with LANDSAT data and served as a focus for unsupervised spectral class development and accuracy assessment. Multitemporal data sets were created from single-date LANDSAT MSS acquisitions from a nominal scene covering an eleven-county area in north central Missouri. Classification accuracies for the four land cover types predominant in the test site showed significant improvement in going from unitemporal to multitemporal data sets. Transformed LANDSAT data sets did not significantly improve classification accuracies. Regression estimators yielded mixed results for different land covers. Misregistration of two LANDSAT data sets by as much and one half pixels did not significantly alter overall classification accuracies. Existing algorithms for scene-to scene overlay proved adequate for multitemporal data analysis as long as statistical class development and accuracy assessment were restricted to field interior pixels.

Contracts NAS9-15800, PROJ. AGRISTARS
Sponsored by NASA, Usda, Dept. Of Commerce, Dept. Of the Interior, and Agency for International Development. Erts.

Early season changes in optical depth change brightness, primarily along the soil line; and during crop development, changes in optical depth change both greenness and brightness. Thus, the existence of haze in the imagery could cause an unsuspecting analyst to interpret the spectral appearance as indicating an episodal event when, in fact, haze was present. The techniques for converting LANDSAT-3 data to simulate LANDSAT-2 data are in error. The yellowness and none such computations are affected primarily. Yellowness appears well correlated to optical depth. Experimental evidence with variable background and variable optical depth is needed, however. The variance of picture elements within a spring wheat field is related to its equivalent in optical depth changes caused by haze. This establishes the sensitivity of channel 1 (greenness) pixels to changes in haze levels. The between field picture element means and variances were determined for the spring wheat fields. This shows the variability of channel data on two specific dates, emphasizing that crop development can be influenced by many factors. The atmospheric correction program ATCOR reduces segment data from LANDSAT acquisitions to a common haze level and improves the results of analysis.

Users Manual for the US Baseline Corn and Soybean Segment Classification Procedure.
Procedures Report, 15 Nov. 1979 - 14 Mar. 1981.
R. Horvath, R. Colwell, C. Hay, M. Metzler, and O. Mykolenko. Mar 81, 274p E81-10190, NASA-CR-160975
Contracts NAS9-15476, NAS9-14565
Sponsored by NASA, Usda, Dept. Of Commerce, Dept. Of the Interior, and Agency for International Development Prepared in Cooperation with California Univ., Berkeley. Erts.

A user's manual for the classification component of the FY-81 U.S. Corn and Soybean Pilot Experiment in the Foreign Commodity Production Forecasting Project of AgRISTARS is presented. This experiment is one of several major experiments in AgRISTARS designed to measure and advance the remote sensing technologies for cropland inventory. The classification procedure discussed is designed to produce segment proportion estimates for corn and soybeans in the U.S. Corn Belt (Iowa, Indiana, and Illinois) using LANDSAT data. The estimates are produced by an integrated Analyst/Machine procedure. The Analyst selects acquisitions, participates in stratification, and assigns crop labels to selected samples. In concert with the Analyst, the machine digitally preprocesses LANDSAT data to remove external effects, stratifies the data into field like units and into spectrally similar groups, statistically samples the data for Analyst labeling, and combines the labeled samples into a final estimate.

Repr. From Vol. Of Extended Abstr.: 15TH Conf. On Agr. And Forest Meteorol. And 5TH Conf. On Biometeorol., 1981 p 205-207. Sponsored by NASA, Usda, Dept. Of Commerce, Dept. Of the Interior, and Agency for International Development. Presented at the 15TH Conf. On Agr. And Forest Meteorol. And 5TH Conf. On Biometeorol., Anaheim, Calif., 1-3 Apr. 1981. Erts.

The NOAA-6 AVHRR data sets acquired over South Texas and Mexico during the spring of 1980 and after Hurricane Allen passed inland are analyzed. These data were processed to produce the Gray-McCrary Index (GMI's) for each pixel location over the selected area, which area contained rangeland and cropland, both irrigated and nonirrigated. The variations in the GMI's appear to reflect well the availability of water for vegetation. The GMI area maps are shown to delineate and to aid in defining the duration of drought; suggesting the possibility that time changes over a selected area could be useful for irrigation management.

Effect of Irrigation Pumping on the Ground-Water System in Newton and Jasper Counties, Indiana.
Water-resources investigations (Final),
Marcel P. Bergeron. Aug 81, 82p USGS/WRD/WRI-81-096, USGS/WRI-81-38
Prepared in cooperation with Indiana State Dept. of Natural Resources, Indianapolis.

Flow in the ground-water system in Newton and Jasper Counties, Indiana, was simulated in a quasi-three-dimensional model in a study of irrigation use of ground water in the two counties. The ground-water system consists of three aquifers. Irrigation pumpage, primarily from the bedrock aquifer, was estimated to be 34.8 million gallons per day during peak irrigation in 1977. Acreage irrigated with ground water is estimated to be 6,200 acres. A series of model experiments were used to estimate the effect of increased irrigation on ground-water levels and streamflow. Model analysis indicates that major factors controlling drawdown caused by pumping in the bedrock aquifer are the variations in thickness and in vertical hydraulic conductivity in a semiconfining unit overlying the bedrock.

Monoterpenes of Lodgepole Pine Phloem as Related to Mountain Pine Beetles.
Forest Service research paper,
Walter E. Cole, E. Park Guymon, and Chester E. Jensen. Jul 81, 14p FSRP/INT-281

Phloem samples taken from 86 healthy lodgepole pine trees were analyzed for content of dry matter, starch, various forms of sugar and nitrogen, and of selected monoterpenes. Beta-phellandrene was, by far, the most prevalent of the monoterpenes. An interactive hypothesis is developed for terpene content as a function of phloem thickness, radial growth, and tree diameter. Here, high concentrations of monoterpens coincide with upper tree diameters, the expected region of high mountain pine beetle survival success.

Forest Service research note (Final),
Carl E. Crisp, Gerard D. Hertel, Paul E. Buffam, and Carroll B. Williams, Jr. May 81, 5p FSRN-PSW-352

Using aerially-applied acephate (Orthene 75S), a phloem-mobile insecticide, to protect loblolly pine (Pinus taeda) against attack by southern pine beetle (Dendroctonus frontalis) does not show promise. In a field experiment near Jacksonville, North Carolina, in 1975, basipetal transport of acephate was assessed. Analyses of residues and gallery length reduction showed that this insecticide did not translocate from the foliage to the phloem of the bole when the trees were sprayed in October at the rates of 1.1 and 2.3 kg. a.i./1851/ha.

Thermonuclear Model for gamma -Ray Bursts.
S. E. Woosley. 26 Aug 81, 23p UCRL-86611, CONF-810871-2
Contract W-7405-ENG-48
Workshop on gamma ray transients and related astrophysical phenomena, La Jolla, CA, USA, 5 Aug 1981.

The evolution of magnetized neutron stars with field strengths of approx. 10 exp 12 gauss that are accreting mass onto kilometer-sized polar regions at a rate of approx. exp 13 M sub 0 yr exp -1 is examined. Based on the results of one-dimensional calculations, one finds that stable hydrogen burning, mediated by the hot CNO-cycle, will lead to a critical helium mass in the range 10 exp 20 to 10 exp 22 g km exp -2 . Owing to the extreme degeneracy of the electron gas providing pressure support, helium burning occurs as a violent thermonuclear runaway which may propagate either as a convective deflagration (Type I burst) or as a detonation wave (Type II burst). Complete combustion of helium into exp 56 Ni releases from 10 exp 38 to 10 exp 40 erg km exp -2 and pushes hot plasma with beta $>$ 1 above the surface of the neutron star. Rapid expansion of the plasma channels a substantial fraction of the explosion energy into magnetic field stress. Spectral properties are expected to be complex with emission from both thermal and non-thermal processes. The hard gamma -outburst of several seconds softens as the event proceeds and is followed by a period, typically of several minutes duration, of softer x-ray emission as the subsurface ashes of the thermonuclear explosion cool. In this model, most gamma -ray bursts currently being observed are located at a distance of several hundred parsecs and should recur on a timescale of months to centuries with convective deflagrations (Type I bursts) being the more common variety. An explanation for Jacobson-like transients is also offered. (ERA citation 06:035535)

Theoretical Studies of Chromospheres and Winds in Cool Stars.
Semiannual Report, 1 Apr. - 30 Sep. 1981.
A. K. Dupree. Nov 81, 8p NASA-CR-164969, SAR-2
Contract NAGW-100

Calculated radiative losses from H, H-, Ca II, and Mg II show that cooling for the chromosphere of the supergiant epsilon Gem do not differ greatly from the solar law, although there are differences at approximately 6000K due to ionization effects. With a rough standard law for computation of stellar winds using the Hartmann-MacGregor theory and standard stellar evolutionary calculations, the wind velocities and temperatures in the HR diagram were systematically explored. Results show that cool winds with tempratures 1,000,00K are not possible for log g or = 2. Predicted wind velocities are approximately 1.5 to 2 x larger than observed, particularly for the most luminous cool stars. The ionization balance for the wind of alpha ORI and the hydrogen profile lines for T Tauri stars were computed using the PANDORA computer program.

Computation of Averaged Monthly Zonal Albedo Utilizing the Solar Zenith Angle, Properties of Clear and Cloudy Atmospheres.
H. Dhuria. Aug 81, 93p NASA-CR-164930
Contract NAG5-75

The zonal temporal averages of albedos at the top of the atmosphere were considered as a function of the length of the day. The length of the day were used to

determine the average daily values of mu sub 0(=Cos of the solar zenith angle, theta sub 0). Polynominal fits of the slope and intercept functions of A sub s (cloud-free albedo) and A sub c(cloud albedo) as function of Cos theta sub 0 were obtained by using the sample values of albedo corresponding to solar zenith angles from 0 to 90 deg with interval of 5 deg. The daily zonal values of mu sub 0 and the surface albedos were used to compute the daily zonal values of albedos at the top of the clear and cloudy atmosphere. The monthly zonal cloud fractions were used to compute planetary albedo A at the top of the atmosphere. The global values of monthly albedos A sub s, A sub c and A were computed by using the weighting function defined as the difference of the signs of zonal values of latitudes. The computer program implementation is also described.

Radiative Transfer in Cometary Dust Atmospheres: Critique of Recent Developments.
O. Vonroos. 1 Oct 81, 20p NASA-CR-164946, JPL-PUB-81-80
Contract NAS7-100

The gas and dust production rates of comets near the sun are intimately linked to the fate of the solar radiation as it is scattered and partially absorbed by the cometary dust envelope or halo surrounding the comet's nucleus. The radiation of nuclear matter (mostly water ice) and the release of dust particles embedded in the ice which are entrained by the escaping gas and subsequently form a dust atmosphere or halo. On the other hand, the interaction of the dust cloud with the solar radiation is in turn responsible for the amount of radiative energy received by the nucleus and thus determines the evaporation rate. It is shown that recent attempts to formulate this problem quantitatively are in error. The correct formulation is given and it is pointed out that negative extinction (enhancement of the primary radiation received by the nucleus due to multiple scattering) may not be as large as predicted.

A Review and Interpretation of Recent Cosmic Ray Beryllium Isotope Measurements.
A. Buffington. 26 Apr 78, 28p NASA-CR-164967
Contracts NGR-05-003-553, W-7405-ENG-48
Submitted for Publication. Presented at a Symp., Washington, D.C., 26 Apr. 1978; Sponsored by the AM. Phys. Soc.

Beryllium-10 is of interest for cosmic ray propagation, because its radioactive decay half-life is well matched to the expected cosmic ray age. Recent beryllium isotope measurements from satellites and balloon covered an energy range from about 30 to 300 MeV/nucleon. At the lowest energies, most of the Be-10 is absent, indicating a cosmic ray lifetime of order 2 x 10 to the 7th power years and the rather low average density of 0.2 atoms/cc traversed by the cosmic rays. At higher energies, a greater propagation of Be-10 is observed, indicating a somewhat shorter lifetime. These experiments will be reviewed and then compared with a new experiment covering from 100 to 1000 MeV/nucleon. Although improved experiments will be necessary to realize the full potential of cosmic ray beryllium isotope measurements, these first results are already disclosing interesting and unexpected facts about cosmic ray acceleration and propagation.

Evolutionary Charts of Solar Activity (Calcium Plages) as Functions of Heliographic Longitude and Time 1964-1979,
E. Ruth Hedeman, Helen W. Dodson, and Edmond C. Roelof. Aug 81, 116p UAG-81, NOAA-81100601
Prepared in cooperation with Johns Hopkins Univ., Laurel MD. Applied Physics Lab.Color illustrations reproduced in black and white.

Evolutionary charts have been prepared at the Applied Physics Laboratory of the Johns Hopkins University on the basis of McMath-Hulbert Observatory data and diagrams, (with the exception of the last three months of 1979, for which plage data from the Hale Observatories and reported in the Solar-Geophysical Data Bulletins have been used). These charts organize data relating to practically all calcium plages reported by the McMath-Hulbert Observatory to World Data Center A for Solar-Terrestrial Physics (Boulder) in the years 1964-1979. The survey covers centers of activity for all of Cycle 20 and the rise to maximum of Cycle 21. More than 200 solar rotations are represented in the charts. In Section II (Table 1) an extensive compilation of data is presented on the principal centers of activity, 1964-1979. The remarks summarize significant solar characteristics as well as terrestrial effects such as geomagnetic storms and energetic particle events. In addition, a quantitative Active Region Index (ARI) and a more detailed Active Region Profile is computed from five solar indicators of the regions' disc transit activity.

The Debate over Acid Precipitation--Opposing Views--Status of Research.
11 Sep 81, 54p Rept no. GAO/EMD-81-131

The use of coal as a substitute for imported oil is raising concern over the possible impact of acid precipitation on the environment and human health. Precipitation can become acidified when sulfur and nitrogen oxides emitted by fossil-fueled powerplants, vehicles, and other man-made or natural sources are chemically changed in the atmosphere and return to earth as acid compounds. Environmental organizations and some agencies and interest groups contend that more stringent emission controls are needed immediately. On the other hand, some agencies and many industries, particularly in the coal and utility sectors, argue that much more research is needed to determine if achievable emissions reductions could significantly diminish the extent of acid precipitation, and if the benefits of such regulations would be worth their potentially high cost.

Chatanika Radar Measurements during the Auroral E Program.
Scientific rept. no. 1,
Robert M. Robinson, and Richard R. Vondrak. Jun 81, 48p AFGL-TR-81-0238
Contract F19628-81-K-0037

Chatanika radar electron-density and electric-field measurements were made during the Auroral E rocket program. Four instrumented sounding rockets were launched into the diffuse aurora from Poker Flat Research Range near Fairbanks, Alaska. The radar provided ionospheric data during eight consecutive nights preceding the launch. The radar data from the night of the launch were analyzed to determine the extent and duration of the auroral E layer. The electron density data indicated that the southward advance of the diffuse aurora was consistent with the average shape of the statistical auroral oval. During the rocket launches the E layer was uniform with a maximum density of about 200,000 to 300,000 el/cu. cm at an altitude of

125 km. The energy flux of precipitating electrons was 1.5 to 2.0 ergs/sq. cm-sec. The mean energy of the electrons was inferred to be about 2 keV. Electric fields were northward with a magnitude of 30 mV/m. No auroral arcs were present within the range of the rocket trajectories.

A Computational Study of the Modification of Raindrop Size Distributions in Subcloud Downdrafts.
Doctoral thesis,
Robert George Borchers. Aug 81, 161p Rept no. AFIT-CI-81-44D

A computational study is made of the variation of steady-state raindrop-size distributions (0.004 cm less than or equal to radius less than or equal to 0.40 cm) in adiabatic subcloud downdrafts of constant magnitude. The cloud base drop-size distribution is assumed to be Marshall-Palmer. The microphysical processes progressively introduced are evaporation, collision-coalescence, aerodynamic and collisional breakup of drops. Collision-coalescence and breakup area treated through a stochastic model. Thermodynamic and hydrometeoric variables of temperature, relative humidity, total liquid water, rainfall rate and radar reflectivity are computed as functions of height below cloud base along with the drop-size distributions. It is found that evaporation tends to deplete, as expected, the smaller members of the droplet population. Computed raindrop-size distributions agree quite well with measured maritime raindrop spectra reported in the literature, the agreement being better for the higher precipitation rates measured. Other results of the study, as anticipated, are (1) that the downdraft remains unsaturated in the presence of precipitation, the degree of subsaturation increasing with the strength of the downdraft, and (2) that the temperature in the downdraft lies between the moist-adiabatic and the dry-adiabatic lapse rates of temperature.

Determination of Ice Crystal Growth Parameters in a Supercooled Cloud Tunnel.
Master's thesis,
Mike Wayne Kowa. Jun 81, 146p Rept no. AFIT-CI-81-36T

In order to completely understand the behavior of a dynamically changing ice crystal as it falls through a supercooled cloud, the simultaneous determination of the crystal size, mass, apparent density, and fall velocity is desirable. Based on the experience obtained in our two previous ice crystal growth studies, a new supercooled cloud tunnel has been developed. It has successfully demonstrated the capability of accurately simulating the crystal growth under free-fall conditions in a natural supercooled cloud. The new vertically converging design for the working/observation section of the tunnel permits ice crystals to be stably suspended in a supercooled cloud airstream for indefinite lengths of time. A new fog chamber is used to make the supercooled fog homogeneous with respect to droplet number and concentration, and temperature, before entering the working/observation section. A method has been developed by which the moisture content in the supercooled fog can be controlled and held constant. The flow rate through the working/observation section is controlled by a specially designed valve which also maintains the total flow into the chamber at a constant level. This configuration keeps the supercooled fog condition constant throughout an experimental run. A special method is devised to preserve the collected ice crystals so they can be photographed from both the top and side. This method also allows for accurate crystal mass determination by melting. The flow velocity, and therefore crystal fall velocity, is continually measured by an electronic manometer while a thermocouple continually records the supercooled fog temperature.

The Lower-Hybrid-Drift Instability in Non-Antiparallel Reversed Field Plasmas.
Memorandum rept.,
J. D. Huba, N. T. Gladd, and J. F. Drake. 29 Oct 81, 31p Rept no. NRL-MR-4612

The lower-hybrid-drift instability is investigated in non-antiparallel reversed field plasmas, i.e., the magnetic fields on either side of a neutral line are not anti-parallel. Such a magnetic field configuration contains magnetic shear which has a stabilizing influence on the lower-hybrid-drift instability. It is found that magnetic shear has an inhibiting effect on the linear penetration of the lower-hybrid-drift mode toward the neutral line. The implications of this result to the reconnection processes in the magnetosphere (i.e., the nose and the magnetotail) are discussed. (Author)

Field Experiments with Artificial Aerosols at San Nicolas Island, California.
Memorandum rept.,
S. G. Gathman, B. G. Julian, L. A. Mathews, and R. M. McClung. 28 Oct 81, 43p Rept no. NRL-MR-4638

Artificial fogs grown on hygroscopic (Salty Dog) nuclei were produced in the marine environment over Laser Bay, San Nicolas Island, California. These fogs were studied using over water optical extinction measurements in the visual, near and far infrared bands as well as by aerosol size measurements from an instrumented aircraft and from a shore based instrument. These studies show that optical extinction in the visible and near infra red wavelengths produced by biologically safe hygroscopic nuclei can be generated in military significant scales in the marine boundary layer. Efficient Radiative Transfer Computations in the Atmosphere.
Master's thesis,
Charles Robert Posey, II. Jan 81, 51p Rept no. AFIT-CI-81-37T

An efficient longwave radiation transfer band model was developed and applied to the MIT Stratospheric General Circulation Model (GCM). The band model is a revised version of models by Ramanathan (1976) and by Alimandi and Viscounti (1979). It is validated by comparison with work by Dopplick (1971), Slade (1969) and by Park and London (1974). The band model produced pole-to-pole heating gradients up to 9 deg K/day compared with Newtonian heating gradients of 1-2 deg K/day used previously in the GCM. In 5 day-model integrations, the band model sharpened erroneous temperature gradients in the GCM when compared with the Newtonian heating scheme. Poleward eddy heat fluxes appear to be too weak in the low-resolution, 6 wave spectral GCM to balance the heating gradients of the band model. An 18-wave spectral GCM is planned by the MIT stratospheric working group. With the band model, global heating rates up to 3 deg K/day are noted. Such global heating rates cannot be sustained in the atmosphere. Methods to achieve global heating balance are explored. The most straight forward method is to set the Horizontal-averaged temperatures of the GCM equal to the radiative equilibrium temperatures of the band model. (Author)

Aerosol Composition in the Marine and Coastal Boundary Layer.
Technical paper,
E. J. Mack, J. T. Hanley, R. J. Pilie, C. K. Akers, and B. J. Wattle. Aug 81, 11p
Contract N00014-81-C-0519
Presented at the Annual SPIE Technical Symposium (25th), v305 n20 held on 24-28 Aug 81 at San Diego, CA.

This paper focuses on aerosol composition data obtained in the North Atlantic, in the Mediterranean, in the northern Gulf of Mexico, off the coasts of California, Nova Scotia and Portugal, and on shore on Cape Cod and on the North Sea Coast of West Germany. The data show that the marine aerosol population varies considerably in composition, particularly in coastal areas, and does not necessarily comprise primarily sea salt aerosols. As a result of these compositional differences, response of the aerosol to fluctuations in relative humidity is expected to differ from one locale or airmass to another. Therefore, aerosol size spectra alone are not sufficient for the prediction of visibility or the potential performance of EO systems under changing humidity conditions. (Author)

Master's thesis,
Mark Evans Schultz. Jun 81, 107p

Comparisons of the predicted aerosol size distributions from the Shettle and Fenn, the Munn-Katz, and the Hybrid models are made with aerosol size distribution data sets collected off the California coast near Monterey in April and May, 1980. It is shown that the mixing volume (inversion height) is an important parameter in predictive aerosol distribution equations. The Hybrid model is determined to be inaccurate when compared with the Shettle and Fenn and the Munn-Katz models. The Shettle and Fenn model consistently provided the most accurate results. However, it requires an input of either total particle concentration or visibility, neither of which are easily measured or predicted. The Munn-Katz model is determined to be the most operationally useful of the three models studied. It depends only on the bulk meteorological parameters of wind speed, relative humidity and altitude. The Munn-Katz model neglects mixing volume and advection. The observed data further suggest than an aerosol model which does not include a continental distribution may be more appropriate for the open ocean environment.

August 1981 Environmental Data for Sites in the National Solar Data Network.
Aug 81, 176p SOLAR/0010-81/08
Contract AC01-79CS30027

Environmental information collected at the sites of the National Solar Data Network is tabulated for each solar site. The sites are grouped into 12 zones, each of which consists of several adjacent states. The insolation table presents the total, diffuse, direct, maximum, and extraterrestrial radiation for the site. It also shows the ratio of total to extraterrestrial radiation. The temperature table gives the average, daytime, nighttime, maximum, minimum, and inlet-water temperature for the site. All of the passive and some active solar sites are equipped with wind sensors which provide information on wind speed and direction. For some sites, a

humidity table provides relative humidity values for day and night. It also gives values for the maximum and minimum humidity for each day. A technical discussion of the instruments and measurements used to obtain the data is included. (ERA citation 06:034490)

Contract NAS1-16052

Data retrievals are simulated for a Nd:YAG lidar suitable for early flight on the space shuttle. Maximum assumed vertical and horizontal resolutions are 0.1 and 100 km, respectively, in the boundary layer, increasing to 2 and 2000 km in the mesosphere. Aerosol and cloud retrievals are simulated using 1.06 and 0.53 microns wavelengths independently. Error sources include signal measurement, conventional density information, atmospheric transmission, and lidar calibration. By day, tenuous clouds and Saharan and boundary layer aerosols are retrieved at both wavelengths. By night, these constituents are retrieved, plus upper tropospheric, stratospheric, and mesospheric aerosols and noctilucent clouds. Density, temperature, and improved aerosol and cloud retrievals are simulated by combining signals at 0.35, 1.06, and 0.53 microns. Particiate contamination limits the technique to the cloud free upper troposphere and above. Error bars automatically show effect of this contamination, as well as errors in absolute density nonmalization, reference temperature or pressure, and the sources listed above. For nonvolcanic conditions, relative density profiles have rms errors of 0.54 to 2% in the upper troposphere and stratosphere. Temperature profiles have rms errors of 1.2 to 2.5 K and can define the tropopause to 0.5 km and higher wave structures to 1 or 2 km.

Variations in Atmospheric Angular Momentum.
Technical Report, 1 Jan. 1976 - 31 Dec. 1980.
R. D. Rosen, and D. A. Salstein. Jun 81, 50p NASA-CR-166712, ERT-TR-A345-T1
Contract NAS5-25870

Twice-daily values of the atmosphere's angular momentum about the polar axis during the five years from 1976 through 1980 are presented in graphs and a table. The compilation is based on a global data set, incorporating 90 perent of the mass of the atmosphere. The relationship between changes in the angular momentum of the atmosphere and changes in the length of day is described, as are the main sources of error in the data. The variability in angular momentum is revealed in a preliminary fashion by means of a spectral decomposition. The data presented should stimulate comparisons with other measures of the length of day and so provide a basis for greater understanding of Earth-atmosphere interactions.

Time-Variable Earth's Albedo Model Characteristics and Applications to Satellite Sampling Errors.
Final Report.
F. L. Bartman. Sep 81, 78p NASA-CR-165781, REPT-0189219-1-F
Contract NAG1-67

Characteristics of the time variable Earth albedo model are described. With the cloud cover mulitplying factor adjusted to produce a global annual average albedo of 30.3, the global annual average cloud cover is 45.5 percent. Global annual average sunlit cloud cover is 48.5 percent; nighttime cloud cover is 42.7 percent. Month-to-month global average albedo is almost sinusoidal with maxima in June and December and minima in April and October. Month-to-month variation of sunlit cloud cover is similar, but not in all details. The diurnal variation of global albedo is greatest from November to March; the corresponding variation of sunlit cloud cover is greatest from May to October. Annual average zonal albedos and monthly average zonal albedos are in good agreement with satellite-measured values, with notable differences in the polar regions in some months and at 15 S. The albedo of some 10 deg by 10 deg. areas of the Earth versus zenith angle are described. Satellite albedo measurement sampling effects are described in local time and in Greenwich mean time.

Radiation Balances and the Solar Constant.
D. Crommelynck. Jul 81, 21p NASA-TM-76612, ESA-SP-143
Contract NASW-3198
Transl. Into English from Proceedings of the Esa Tech. Conf. (France), 1979 p 137-143. Translation Was Announced as N80-21812. Transl. By Scientific Translation Service, Santa Barbara, Calif. Conf. Held in Lannion, France, 17-21 Sep. 1979.

The radiometric concepts are defined in order to consider various types of radiation balances and relate them to the diabetic form of the energy balance. Variability in space and time of the components of the radiation field are presented. A specific concept for sweeping which is tailored to the requirements is proposed. Finally, after establishing the truncated character of the present knowledge of the radiation balance, the results of the last observations of the solar constant are given. Ground and satellite measurement techniques are discussed.

Atmospheric Turbulence as a Function of Height above Various Surface Materials.
Interim rept.,
Daniel H. Garcia. 23 Sep 81, 23p Rept no. NRL-8518

The atmospheric refractive-index structure parameter C 2 sub n was determined at heights 0.5 to 5 meters above open-field grass, blacktop, concrete, and aluminized-Mylar sheets attached to plywood. Measurements were made of the temperature structure parameter with twin fast-response, temperature-sensing probes made of 2-micrometer diameter platinum wire which were separated 10 cm and optimally excited at 10 microwatts. The RMS value of the temperature difference between the probes was determined with R. W. Harris double-AC bridge/log-meter system. Probe height was changed approximately every 30 minutes. The differential temperature and the meteorological parameters comprising air temperature, dew point, wind speed and direction, solar insolation and barometric pressure were sampled at 1-second intervals. Results indicate a height dependence of the form C 2 sub n = KH to the minus M, where K is a function of the surface (0.84 < or = K/10 to the minus 13th power m to the minus 2/3 power < or = 1.8) and M = - 1.2 + or - 0.5, with the wide variation in M due to changing meteorological conditions, most importantly solar insolation and wind speed. In this experiment, no significant differences in average value of C 2 sub n could be determined for the four surfaces. Additionally, the anticipated reduction in turbulence over aluminized Mylar was not observed.

Techniques for the Computation of Wind, Ceiling, and Extinction Coefficient Using Currently Acquired RPV Data.
Final rept.,
James L. Cogan. Jul 81, 62p Rept no. ERADCOM/ASL-TR-0093

Proper deployment and accurate targeting of precision guided munitions depend partly on knowledge of wind velocity, ceiling, and electro-optical extinction in the target area; and knowledge of wind in the target area is crucial for the correct placement of smoke munitions. Wind velocity, ceiling, and volume extinction coefficient in the data silent region near the target may be computed by methods developed in this report using only data currently acquired by a remotely piloted vehicle of the type now being developed for use by the Army. No new instrumentation is required. The required input consists of flight data and data from an onboard imaging system. (Author)

Topographically Induced Diurnal Boundary Layer Oscillations: Two Dimensional Synoptic Scale Modeling.
Doctoral thesis,
David W. McLawhorn. Dec 79, 187p Rept no. AFIT-CI-79-269D
Grant NSF-ATM77-26094

A two dimensional boundary layer model is developed for the study of diurnal cycles in boundary layer convergence over synoptic scale sloping terrain and thermally inhomogeneous surfaces. To properly resolve the terrain configuration, a local terrain following coordinate system is developed. The local coordinate system has characteristics which are superior to the terrain following coordinate systems commonly used. Truncation errors are significantly reduced in the local system so variations in the flow field due to physical forcing are easily discernable from those due to truncation error. Also, it appears that the local system can resolve coarser terrain configurations under numerically stable conditions. The model exhibits a sensitivity to latitude. The phase of the maximum vertical velocities forecast by the model occurs six hours later at 22 deg N. vs. 38 deg N. The boundary layer model is apparently not very sensitive to radiative flux divergence calculations but did show a marked reaction to soil type. Both the amplitude and phase of the maximum vertical velocities are modified by changes in soil type. (Author)

A Numerical Study of the Role of Air-Sea Fluxes in Extratropical Cyclogenesis.
Doctoral thesis,
Scott Alphonse Sandgathe. Sep 81, 135p

This study uses a numerical model to investigate the effect of the air-sea fluxes of sensible heat and moisture in extratropical cyclogenesis over the open ocean. The model is a sectorized version of the UCLA general circulation model including the Arakawa-Schubert cumulus parameterization scheme and the Randall version of the Deardorff planetary boundary layer parameterization. Idealized initial conditions are specified in the atmosphere and ocean that are typical of open-ocean fall and spring conditions. Adiabatic and diabatic model results are compared over a 15-day integration period. Diabatic processes, including the surface fluxes, cause a large reduction in low-level static stability during the initial cyclone growth period. This reduction in static stability, as well as the latent heat release, leads to the rapid growth of wave numbers 12 and 18 in the diabatic model experiment, while only wave number 6 is present in the adiabatic experiment. The growth of the cyclones is much more rapid in the diabatic experiment. However, cyclones in the adiabatic experiment attain similar maximum intensities as in the diabatic experiment, and undergo an analogous decay period.

A Two-Dimensional Finite Element Advection Model with Variable Resolution.
Master's thesis,
Mark Elwood Older, III . Jun 81, 83p

Many meteorological forecast applications require the use of grids that have a high resolution in a particular area of interest, while allowing coarser resolution elsewhere. Conventional finite difference models often use nested grids to this end. In recent years, finite element models have been offered as an alternative. In this study, the two-dimensional advection equation with diffusion is defined over a rectangular domain. The Galerkin technique is applied to linear basis functions on triangular elements. The model is tested to determine the sensitivity of the forecast to various nodal geometries. Both equilateral and right triangular elements are tested. It is found that the equilateral arrangement consistently yields a superior forecast. Other tests are conducted in which the resolution is varied smoothly versus abruptly over the domain. The smoothly varying case gives results that are dramatically improved over the abruptly varying case. Among the conclusions is the fact that, for a given maximum resolution, the more slowly and smoothly the element size is changed, the better the forecast obtained. (Author)

Contract W-7405-ENG-48
AMS conference on mountain meterology, Steamboat Springs, CO, USA, 10 Nov 1981.

Several terrain-dominated air-flow phenomena affect the problem of pollutant transport over complex terrain. One of these in nocturnal valley drainage flow, chosen as the initial focus of the ASCOT program. For this study we chose the Geysers geothermal area in Northern California as the initial study site. Objectives for this study were defined as, (1) to augment the present knowledge of the physical mechanisms involved in the development, perpetuation, and breakup of nocturnal drainage flows; (2) to develop an integrated measurement and modeling methodology to perform air quality impact assessment and control strategies for energy development in areas subject to drainage flows; and (3) to provide the developed methodology with special applications to the H sub 2 S emissions associated with the Geysers geothermal development. This report summarizes the field and modeling efforts that have been conducted thus far and discusses preliminary results and future plans. (ERA citation 06:035431)

Implication of Spatial Averaging in Complex Terrain Wind Studies.
W. M. Porch. 19 Jun 81, 8p UCRL-85525-Rev.1, CONF-811104-1(Rev.1)
Contract W-7405-ENG-48
AMS conference on mountain meterology, Steamboat Springs, CO, USA, 10 Nov 1981.

Studies of wind over complex terrain have been conducted at two different times at the Geyser's Geothermal Region of Northern California. These studies have included optical anemometers with spatial averaging (Lawrence et al., 1972) over path lengths of 0.6 to 1 km and conventional cup-vane anemometers. Most of the work described in this paper resulted from field studies conducted as a part of ASCOT (Dickerson and Gudiksen, 1980) experiments in July, 1979 and September, 1980. It represents an effort to use measurements of spatially averaged wind to obtain the average drainaged wind speed component down a small slopping valley with few locations with reasonable instrument exposure accessible to cup anemometers. By comparing the point and spatially averaged wind measurements, it was hoped that data periods could be chosen for numerical wind field model testing when the two measurements were similar. Some Analysis on the Diurnal Variation of Rainfall over the Atlantic Ocean.
T. Gill, S. Perng, and A. Hughes. Aug 81, 55p NASA-CR-164937
Grant NSG-5295

Data collected from the GARP Atlantic Tropical Experiment (GATE) was examined. The data were collected from 10,000 grid points arranged as a 100 x 100 array; each grid covered a 4 square km area. The amount of rainfall was measured every 15 minutes during the experiment periods using c-band radars. Two types of analyses were performed on the data: analysis of diurnal variation was done on each of grid points based on the rainfall averages at noon and at midnight, and time series analysis on selected grid points based on the hourly averages of rainfall. Since there are no known distribution model which best describes the rainfall amount, nonparametric methods were used to examine the diurnal variation. Kolmogorov-Smirnov test was used to test if the rainfalls at noon and at midnight have the same statistical distribution. Wilcoxon signed-rank test was used to test if the noon rainfall is heavier than, equal to, or lighter than the midnight rainfall. These tests were done on each of the 10,000 grid points at which the data are available.

In a double passage through a route laid out in a stagnaton zone of the Bavarian forest, it was found that the stagnation and attendant elevation increases the danger of icing. Conversely, it turned out that formation of precipitation reduces the icing intensity. A comparison of both factors showed: the reduction of ice formation through precipitation equals the increase due to stagnation, or even exceeds it.

Observations of the Modification of Cloud Condensation Nuclei in Wave Clouds.
Journal article,
Dean A. Hegg, Peter V. Hobbs, and Lawrence F. Radke. 1980, 8p CONTRIB-560, EPA-600/J-80-359
Grant PHS-HS-805263
Pub. in Jnl. de Recherches Atmospheriques 14, p217-222 1980.

Measurements are presented which show enhanced concentrations of cloud condensation nuclei, active at various supersaturations, downwind of wave clouds. Concurrent measurements of particle size spectra corroborate these measurements and suggest particle growth within the clouds. Modifications in the particle size spectra are most pronounced at diameters of approximately 1 micrometer. Measurements and modeling results suggest these observations can be explained by sulfate production in clouds.

Contract DI-7-07-83-V0008
Prepared in cooperation with Flueck Associates, Wynote, PA., and Sierra Hydrotech, Placerville, CA.

This research was concerned with continuing design work on the Sierra Cooperative Pilot Project (SCPP) being sponsored by the Bureau of Reclamation in the northern Sierra Nevada of California and Nevada. Seeding scenarios are presented for aerial curtain seeding of major precipitation bands and for ground based seeding of post-frontal convective cells. It has been determined that major bands commonly occur in the SCPP target area. The seeding scenarios deal with recommended treatment modes as well as estimates of potential cloud seeding effects.

Still No Progress in Implementing Controls over Contracts and Grants with Indians.
10 Sep 81, 96p Rept no. GAO/CED-81-122

Report to the Chairman, Committee on Interior and Insular Affairs, House of Representatives.

On January 3, 1980, the Chairman of the House Committee on Interior and Insular Affairs requested that we review the accountability of Federal funds and property used in Government contracts and grants with Indian tribes. The Chairman asked for recommended solutions to problems identified in our February 1978 report entitled 'Controls Are Needed Over Indian Self-Determination Contracts, Grants, and Training and Technical Assistance Activities To Insure Required Services Are Provided to Indians' (CED-78-44, Feb. 15, 1978). In our February 1978 report was stated that the Bureau of Indian Affairs (BIA) did not have adequate control over contracts, grants, and technical assistance activities authorized by Title I of the Indian Self-Determination and Education Assistance Act. We agreed to determine if the situation has improved at BIA and if other Federal agencies are having the same problems. (Author)

Progress in Improving Program and Budget Information for Congressional Use.
1 Sep 81, 29p Rept no. GAO/PAD-81-88
Report to the Congress.

This report is submitted to the Congress in accordance with section 202 (e) of the Legislative Reorganization Act of 1970. This section requires us to report annually on the progress and results of our continuing program, undertaken in accordance with the 1970 Act, as amended by Title VIII of the Congressional Budget Act of 1974, to improve the fiscal, budgetary, and program-related data and information reported to the Congress. The relevant statutory provisions assign GAO responsibilities for: developing standard terminology, definitions, classifications, and codes for Federal fiscal, budgetary, and program-related data and information reported to the Congress; conducting a continuing program for identifying and specifying the needs of the Congress for fiscal, budgetary, and program-related information; monitoring the recurring reporting requirements of the Congress and making recommendations for changes and improvements in such requirements; maintaining inventories and directories of sources and information systems containing fiscal, budgetary, and program-related data and information; maintaining central files of Federal fiscal, budgetary, and program-related data and information to meet the recurring requirements of the Congress; evaluating the extent to which the executive branch reporting meets identified information needs and specifying the changes required to meet congressional needs; cooperating with the executive branch in standardization of the budget, fiscal, and program-related information systems; and cooperating with the executive branch in meeting the needs of State and local governments for budget, fiscal, and program-related information. Concerns about HHS' Ability to Effectively Implement Incentive Funding for State Information Systems in the Aid to Families with Dependent Children Program.
29 Jun 81, 16p Rept no. GAO/HRD-81-119

Public Law 96-265, enacted on June 9, 1980, authorized the Federal Government, beginning on July 1, 1981, to pay 90 percent of the costs incurred by States for the planning, design, development, or installation of statewide mechanized claims processing and information retrieval systems for administering the $11.3 billion Aid to Families with Dependent Children (AFDC) program. The Federal Government currently pays 50 percent of both development and operating costs related to these systems. Public Law 96-265 contained several specific conditions for obtaining increased Federal matching funds. First, the system must operate on a statewide basis; control all factors in the eligibility determination process; control and account for the costs, quality, and delivery of funds and services furnished to applicants and recipients; provide eligibility information to other welfare programs; and provide security against unauthorized access to data in the system. Second, the Secretary of the Department of Health and Human Services (HHS) must determine that the system is likely to provide more efficient and effective administration of the AFDC program and be compatible with systems used to administer Social Services programs and Medicaid. Ineffective Management of the Appropriate Technology Small Grants Program.
15 Sep 81, 10p Rept no. GAO/EMD-81-113

Energy-related appropriate technologies are those which are small-scale and labor-intensive, use locally available resources, reduce reliance on scarce or nonrenewable energy resources, and are environmentally sound. The development and application of these technologies can increase the mix of energy options available to individuals and the Nation by providing alternatives to capital-intensive, centralized energy technologies; reduce energy costs to individuals; provide employment opportunities; and increase local self-reliance.

Allegations of Unfair Bidding Requirements at Griffiss Air Force Base, Rome, New York.
1 Sep 81, 2p Rept no. GAO/PLRD-81-63

We found that the procedures followed by Griffiss comply with existing Defense Acquisition Regulations which require a performance bond for any fixed-price construction contract in excess of $25,000. The same regulations require a bid guarantee of not less than 20 percent of the bid amount. The bid guarantee may take the form of a bid bond, postal money order, certified check, cashiers check, irrevocable letter of credit, or certain bonds or notes of the United States. In Mr. Harvey's case, in lieu of a bid bond, which he says he cannot secure, the guarantee would have to be in one of the other forms mentioned above.

HUD's Oversight of Procurement by Public Housing Authorities Needs Strengthening.
30 Sep 81, 2p Rept no. GAO/PLRD-81-68

In summary, we found that personnel responsible for procurement at the six housing authorities frequently lacked the skills and knowledge about the techniques needed to make efficient and economical buys. As a result, there was no assurance that competition was being obtained to the maximum extent feasible or that payments were being made for goods actually delivered or for services actually performed. We also found that your agency's periodic reviews of the authorities' procurement practices did not disclose the situations we found. We believe this happened because HUD's guidance is much too general to its staff charged with making these periodic reviews. (Author)

GAO Comments on the Impact of the USDA Reorganization of Nutrition.
17 Aug 81, 13p Rept no. GAO/CED-81-150

This letter responses to the June 24, 1981, request for comments on the June 1981 reorganization of the U.S. Department of Agriculture (USDA) and its impact on nutrition. As requested, comments on the reorganization address those areas that relate to USDA's nutrition responsibilities and activities. USDA is in the process of implementing the reorganization and identifying, addressing, and resolving the management and policy problems that occur with any reorganization. Also, details of USDA's nutrition policies have not been fully formulated. As a result, comments are based primarily on what USDA officials have told us and on the opinions of professionals from the nutrition community. Because the reorganization is just now being implemented, we are unable to reach any conclusions on the reorganization's impact on USDA's nutrition responsibilities nor on the broader impact on nutrition research, information and education. Any reorganization can be expected to disrupt operations in the short-run and affect the momentum in nutrition that had been established over the last few years. Whether that momentum continues under the new reorganization remains to be seen.

An Examination of Year-End Spending with Regard to Department of Defense Contract Awards.
Master's thesis,
James M. Farrell, and Paul K. Spendley. Jun 81, 186p Rept no. AFIT-LSSR-40-81

Investigations conducted by Congress and the General Accounting Office have indicated that a number of Federal agencies, including the Department of Defense (DOD), engage in a year-end spending practice which potentially wastes billions of tax dollars annually. This practice is commonly known as year-end spending surge. The objective of this research was to analyze DOD contract award data to determine the magnitude of any year-end spending surge and to identify the types of procurement activities and the types of commodities involved in the surge. Data pertaining to DOD and Air Force (USAF) contract awards to U.S. business were analyzed for fiscal years 1977 through 1980. The authors concluded that the DOD and the USAF experienced a year-end spending surge. Further, each type of procurement activity examined had a unique award pattern, and not all activities experienced year-end surge. For the USAF, the magnitude of surge of base procurement was the major influence on the magnitude of the USAF surge. The study also includes information concerning the possible influence of appropriations and supplemental appropriations on the DOD year-end surge. Additionally, an examination of DOD award patterns from fiscal years 1952 through 1976 is presented in an appendix. (Author)

Terminating the Audit of the National Flood Insurance Program's Fiscal 1980 Financial Statements.
21 Sep 81, 8p Rept no. GAO/AFMD-81-93

In summary, a financial reporting system was to have been in place that should have enabled FEMA (Federal Emergency Management Agency) to effectively carry out its responsibilities under the Government Corporation Control Act. EDSF (Electronic Data Systems Federal Corporation) was to provide the necessary monthly reports of NFIP's (National Flood Insurance Program) insurance operations; FIA (Federal Insurance Administration), as program monitor, was to assure that EDSP provided accurate, complete, and timely data; and FEMA was to incorporate the financial information into its own accounting system for later reporting needs, including preparation of NFIP financial statements. The inability to prepare financial statements reflects negatively on the adequency of NFIP's accounting system, the financial management of the program, and management's commitment to a sound system of internal accounting controls. This is due to the following weaknesses: (1) FEMA Accounting did not carry out its accounting control responsibilities for the Flood Program, (2) The contract with the insurance program operator, EDSF, did not specify essential controls and financial reports, (3) EDSF did not maintain adequate accounting controls over financial reporting; and (4) FIA did not adequately monitor EDSF operations.

Mission Impact Generalized Explanatory Base Operating Support Model Development: Final Management Summary.
Final technical paper 1 Dec 80-30 Jun 81,
Edward J. Schmitz, Roy E. Smoker, and John N. Taylor. Sep 81, 37p AFHRL-TP-81-30
Contract F33615-80-C-0023

The Mission Impact Generalized Explanatory Base Operating Support Model (GEBOS-M) can compute Air Force Major Command (MAJCOM) Base Operating Support (BOS) and Real Property Maintenance Activities (RPMA) manpower requirements directly from programmed changes in mission elements. GEBOS-M provides manpower managers with a quick turnaround capability to program and justify base level support manpower changes in functional category level of detail, tied directly to changes in mission capability. This test model applies to Strategic Air Command (SAC), Tactical Air Command (TAC), and Air Training Command (ATC)/U.S. Air Force Academy (USAFA). With further work, it can be extended to apply Air Force-wide. Initial validation tests were completed. They demonstrated consistent and reliable relationships between primary mission activities and their supporting BOS/RPMA workload and manpower levels. The supporting manpower and workload elements addressed by the model include all Department of Defense (DOD) functional categories comprising the BOS/RPMA program elements. (Author)

Budgetary Pressures Created by the Army's Plans to Procure New Major Weapon Systems are Just Beginning.
20 Oct 81, 32p Rept no. GAO/MASAD-82-5
Report to the Congress.

The Army is now facing the problem of funding the procurement of all 14 of its new major weapon systems. Recent experience has shown that as new Army weapons begin production, procurement costs run considerably higher than anticipated. Since 11 of the 14 weapon systems have not yet gained any significant production experience, their cost estimates are likely to be on the low side. Fielding all 14 new systems during the next decade is likely to seriously strain the Army's operation and support resources since, compared to present weapons, these systems will require more people with higher skills, as well as increased expenditures for fuel, spares, and ammunition. GAO recommends improvements in planning for the procurement and eventual support of these weapon systems to alleviate the future budgetary strains they could impose. (Author)

U.S. Technology Transfer to the Soviet Union: A Dilemma.
Research rept.,
Rodney P. G. Bricker. Apr 81, 146p Rept no. MS094-81

The transfer of technology from the U.S. to the Soviets started to accelerate during the Nixon administration. The pace increased even more briskly through the first three years of the Carter Administration. Today, the entire question of technology transfer is under serious discussion. What is the status now. What is the role of the Departments of Defense. What are the interests of the Commerce Department and the Department of State. Does the nation need an Office of Strategic Trade to control the movement of strategic commodities and critical technologies. This study examines the background of the past 10 years of technology transfer, the Bucy Report then and now, activities at the Department of State, Commerce, and Defense, the role of the FBI and of the National Technical Information Service, describes a typical tough technology transfer review, gives the Soviet perspective, and looks at many Soviet visitors who are 'students.' The proposed Office of Strategic Trade is explained and proposed as one solution to the problem derived from many points of view, while another equally manageable and effective approach aimed at refining the present organization and keeping the responsibility in the Department of Commerce also is discussed.

Allocation of an Air Force Contractor's Pension Fund Assets May be Inequitable.
23 Sep 81, 5p Rept no. GAO/HRD-81-152

During our review of contractor's compliance with cost accounting standards relating to pension costs, we found that the pension plan for Pan American World Airways, Inc. (Pan Am), had experienced significant actuarial gains from unanticipated job terminations of employees working on an Air Force contract. At the time of our fieldwork in 1979, Pan Am had initiated actions to establish separate pension plans which would ensure that the Government received proper credit for these termination gains. However, as of July 1981, these actions had not been completed and it appears that the method proposed by Pan Am for allocating pension plan assets may not be equitable to the Government. We believe that you should act to ensure that the pension plan established for employees working on Government projects receives an equitable share of assets. (Author)

Preliminary Analysis of Technical Risk and Cost Uncertainty in Selected DARPA Programs.
Final rept.
6 Oct 81, 37p
Contract MDA903-81-C-0375, DARPA Order-4287
Supersedes report dated 30 Sep 81, AD-A105 671.

This report documents the analytical results and conclusions of a four-month investigation of cost and uncertainty in selected DARPA programs. The analysis focuses on risk and the management of risk from a technical, cost, and schedule perspective through a comparison of DARPA experience to a large experience base of other federal programs. The results indicate that DARPA experience in the management of high technology programs can be interpreted (and to some degree of accuracy, forecasted) using this experience base. In addition, this analytical and empirical approach can be used to assist DARPA in complying with recent DOD directives to recognize risk in budgeting and planning estimates. Most importantly, the study effort demonstrates that it is possible to identify qualitative indicators to characterize risk and to use such descriptors as the basis for risk management.

Implementation of Subcontracting Provisions of Public Law 95-507 within Air Force Logistics Command and Air Force Systems Command.
Master's thesis,
Shawn F. Graves, and William D. Ritchie. Jun 81, 175p Rept no. AFIT-LSSR-17-81

Following the passage of PL95-507 in October, 1978 there has been continued controversy among the lawmakers, DOD, SBA, and industry as to the overall support of the program. Especially noteworthy is the effect and utilization of the subcontracting plans required by law. This study narrows the scope of the problem to the implementation of the law through the use of the current Air Force Guidelines. The objectives are to validate the guidelines and analyze any weaknesses discovered. The researchers conclude that the current guidelines do effectively implement the law. However, it is recommended that better communication be established between contracting officials and SBA and a clarification of ambiguous and redundant wording in the guidelines be made. Additionally, both reporting and records requirements need to be standardized and new policy statements need to be incorporated into the guidelines. Specifically, guidelines 6, 7, 8, 9, 16 and 23 need to be rewritten/expanded for ease of user interpretation and litigation.

Determination of Contract Suitability to the Award Fee Concept.
Master's thesis,
Holly R. McLelland, and David D. Odor. Jun 81, 50p Rept no. AFIT-LSSR-27-81

The concept of the Award Fee contract has existed within the federal government since the 1950s. The Navy and the National Aeronautical and Space Administration used Award Fee contracts on a limited basis in the early 1960s. The Air Force still considered their use experimental as late as 1978. In FY 79 Award fee accounted for 2.9 percent of all contracts over $10,000, and totaled over $1.5 billion. An estimate of the government's administrative costs for a moderate-sized Award Fee program was $115,000 annually. The burden of the administrative costs is considered to be justified when the government realizes greater benefits as a result of the Award Fee provision. There is a general lack of definitive guidance for evaluating the suitability of any contract to the Award Fee concept. With no formalized guidelines for the selection of a contract, there is no objective way to judge the possible, or probable, cost to benefit ratio of a given contract.

ADPE Acquisition: The Acquisition of the Naval Postgraduate School Computer, A Case Study.
Master's thesis,
John Earl Boyle. Sep 81, 48p

The federal computer acquisition process is examined by studying one particular major computer system acquisition. The manner in which the principals involved conducted the acquisition in relation to the political and regulatory environment is examined and displayed in a case study format. Although the situational facts involve a computer acquisition for the Naval Postgraduate School, broad issues are developed which apply universally to public and private sector computer systems acquisition. The case exposes the reader to the issues of specification development, conversion costs, benchmark testing, and the role of competition in computer acquisition. Attention is focused on the environment in which a computer system need is developed and how that need is 'marketed' through the review and support process of a large organizational buying system.

The Relationship between Adequacy of Test and Evaluation Data and DS ARC Decisions.
1 Jun 81, 174p
Contract MDA903-80-C-0591

The objective of this research was to gain a better understanding of how the adequacy of test and evaluation (T and E) data affects defense system acquisition review council (DSARC) decisions. Specifically, the study focused on the adequacy of the T and E data presented at milestone reviews as a possible reason for conditional decisions. Conditional decisions are those that nominally approve entry into the next phase of acquisition, but also impose restrictions on the pace of development or rate of production. Such restrictions invariably increase the time and cost of the acquisition process. This study showed that while most milestone II and III decisions are, in fact, made conditionally, the adequacy of T and E is not the predominant factor. However, when DSARC issues do arise which involve the quantity or quality of T and E data available for decision-making, it is generally because of a lack of communication between OSD and the services. Clarification of milestone review policies, early identification of T and E issues associated with the selected acquisition strategy, and vigorous use of the test and evaluation master plan (TEMP) are some of the ways this aspect of the acquisition process can be improved in the present environments of decentralized operations and centralized decision-making. ORNL Direct Purchase Information System (DPIS) User's Manual.
J. W. Grubb, J. K. Lovin, M. B. Smith, R. L. Haese, and D. B. Needham. Aug 80, 106p
Contract W-7405-ENG-26

The ORNL Management Information System (MIS) Direct Purchase Information System (DPIS) is an online interactive system of computer programs. The system can provide a manager with commitment and delivery schedule information on current direct purchase requisitions. The commitment data accounts for the orders that have been placed and those requisitions yet to be placed with a vendor. Information can be summarized at many different levels, and individ-

uals can quickly determine the status of their requisitions. DPIS contains data only on active outside direct purchases, but has the capability to access historical data. It provides sufficient flexibility to be used to answer many questions pertinent to the status of these direct purchases and their obligating costs. Even an inexperienced computer user should have little difficulty in learning to use DPIS. The User Module prompts the user on what type of response it is expecting. If the user has doubts as to the response, or if the meaning of the response is not clear, the module will give a detailed list of the options available at that level. The user has control of what data are to be considered, how they are to be grouped, and what format the output will take. As the user selects the options available at a given level, the module proceeds to the next lower level until sufficient input has been supplied to provide the requested information. A major benefit of this interactive, user-oriented system is that the manager can specify the information requirements and does not have to spend time going through a great deal of other data to locate what is needed. Because it is interactive, a search can begin at a summary level and then resort to a more detailed level if needed. DPIS allows the user direct control for selecting the type of commitment data, output, funds, and direct purchase. (ERA citation 05:033152)

Anatomy and Assessment of Program Planning at the National Eye Institute,
Helen M. Riches. Jan 81, 108p NEI-80-301

Although the National Eye Institute and the National Advisory Eye Council have performed evaluation and planning activities and have produced several such documents over the past five years, there has never been systematic and comprehensive description of the history and development of these activities or an assessment of their efficacy. By means of summarizing previously published materials the contractor has produced a history and description of the NEI's comprehensive program evaluation and planning activity, and an assessment of NEI evaluation and planning strategy and process from its inception through the development of the five-year plan for the years 1978-1982. This project has produced a document that presents an integrated and comprehensive picture of the NEI's program planning function: how it developed; the approach, rationale, and guiding precepts; who has participated; what the process is; and what has been accomplished to date. This is accompanied by an assessment of the current status of planning at the NEI and recommendations for strengthening the process.

State-Local Policy Management Project.
Final rept.
Nov 81, 82p
Grant NSF-ISP78-20518
Prepared in cooperation with Dwight Jensen Associates, McLean, VA.

The case studies in this report are the result of a joint project begun nearly three years ago to explore new approaches for increasing state-local coordination in the planning and management of programs in the energy and environmental areas. The purpose of the State-Local Policy Management Project was not new research, but rather to draw valuable lessons from those in policy-making and management positions who have sought -- with varying degrees of success -- to make the intergovernmental system work more effectively. This report should serve to reinforce much of the conventional wisdom about the benefits of sound intergovernmental cooperation. It also contains much information that can be of help to officials who wish to devise better ways of dealing with state-local problems.

Economic Development Administration, Washington, DC. Program Analysis Div.
A Preliminary Examination of EDA Feasibility Studies.
Apr 71, 25p

Feasibility studies constitute a substantial percentage of the projects supported by EDA. They analyze whether a proposed project is capable of implementation, whether it merits the required investment of funds, and they provide a blueprint for implementation of the project in the future. The 101 feasibility studies with positive recommendations were analyzed to determine if follow-up activity occurred and the nature of that activity. The study concludes that feasibility studies with positive recommendations often do not lead to any implementation of the recommendations.

Research on the use of alternative decision models for technology assessment is presented. The report discusses the generally accepted perspective, its limitations, and earlier work on multiple perspectives including Allison's models and perspectives of Steinbruner and Andersen. Past decisions are considered first in terms of these perspectives and later as an ongoing living system where the investigator is an active participant. A major portion of the report focuses on proposed perspectives for technology assessment and consists of a wide spectrum of illustrations and applications and various stages of development. These include a case study of health care delivery systems, and decisions involving military and corporation technology, electronics funds transfer, the commercialization of guayule, and on-site solid waste treatment. Implications are drawn from these experiences and guidelines are developed for the user. Specific guidelines for implementation of an organizational and personal perspective ffor technology assessment is included in the appendices.

This report is a condensed version of a document on the use of alternative decision models for technology assessment. Presented are (1) the usual perspective and its limitations; (2) multiple perspectives of Allison, Steinbruner, and Andersen; (3) proposed perspctives; (4) illustrations and applications of proposed perspectives and (5) guidelines. The examples span a wide spectrum of uses of multiple perspectives and include military and corporation technology, an electronics funds transfer, guayule commercialization, on-site solid waste treatment, and a case study of a health care delivery system. Guidelines developed for the multiple perspective user involve socio-technological systems in general.

This exploratory study of local government technological innovation focuses on several potential local external and internal determinants of innovation. The principal methods used are (1) a review of local government technological innovation studies and other relevant literature for developing a conceptual framework; (2) a questionnaire survey of selected local governments in the Midwest for the purpose of gathering additional data on innovation, testing a hypothesis, and assessing the utility of particular questionnaire items as potential members of internal and organization-related determinants of innovation; and (3) pilot studies in two Midwest local governments in which interviews and questionnaires are used to identify and explore in greater depth the potential and internal determinants of innovation. The municipal service area selected for study are the fire services. Seven fire technologies were examined as potential innovations and the mini-pumper fire truck was chosen as a special focus of the study.

Applied Research Summary of Awards, Fiscal Year 1980.
1980, 71p NSF-80-92, NSF/RA-800620

New awards made in FY 1980 by the Division of Applied Research (DAR) in the Engineering and Applied Science (EAS) Directorate are described. Research in applied social and behavioral sciences include programs concerned with public policy and regulation; public service delivery and urban problems; industrial organizations and markets; and individual and group processes. Research in applied physical, mathematical and biological sciences and engineering include programs in physical, mathematical, and engineering applications; biological and ecological applications; and geophysical and environmental applications. Current 'coherent areas' of DAR consist of research programs on growth, income, and employment; regulation; telecommunications; and production and technology. Other programs involve small business research and research initiation in applied social and behavioral sciences. The presentation format includes the title of the specific grant; the name of the principal investigator; the name and address of the institution conducting the research; the beginning date, amount, and duration of the grant; and a detailed summary of the project.

This report surveys current proprietary and private systems as a step towards choosing the most convenient apparatus for research work at UMIST into the control of building engineering services. The report is divided into three main sections. Section 2 reports the historical evolution of building automation systems which led to the present system architectures and current practices. Section 3 reviews current automation systems. Reference is not only made to building automation systems but also to some general process control systems and interfaces used in industrial control systems. Section 4 gives some conclusions which, when combined with those of Part 1 of this report series, provide a basis for the proposed work in the control of building engineering services.

The advent of the mini digital computer led to Centralized Control Systems which concentrated all information and supervision at a central point. It was soon found, however, that like the dinosaur the signal paths could become extremely long and were vulnerable to failure and breakage. The logical result was to place data and control concentrated locally at important points while still sending data back to a central information center. Thus a distributed or hierarchical data acquisition (measurement) and Control Systems evolved. Nowadays the emergence of the microprocessor has made it possible to conceive of even greater schemes of data acquisition and control and brought new problems. This paper studies the concepts of the topology of a Distributed microcomputer based Data Acquisition and Control (D-DAC) System.

The distributed data acquisition and control (D-DAC) system is an integrated hardware-software architecture. The software reflects the distributed concept by replicating at every station the same basic structure based upon a simple supervisor program supervising five main station tasks; communication initialization, application initialization, bus control, communication control and system application interface. This report proposes an implementation and specifies the modules software interfaces and the character-oriented communication protocols. An outline of the software development system shows how a DEC system 10 is on-lined with the D-DAC system.

Scientific Research and Basic Needs of the People: A Method of Assessing Research Projects (Investigacion Cientifica Y Necesidades Basicas de la Poblacion: Un Metodo de Evaluacion de Proyectos),
Felipe Lara, and Lourdes Aragon. Oct 81, 108p 442
Text in Spanish.

A method is proposed that permits assessing research projects according to their impact upon the satisfaction of basic needs of the marginal population. Two kinds of impacts are considered: direct effects, when the research problem has a straightforward relationship with basic needs, and indirect effects, when the research project helps to develop a specific scientific area that can introduce new solutions to basic needs. The method of evaluation presented here was developed

with the participation of the academic community. To illustrate its usefulness, an example from the social sciences has been considered.

Rationale Statements for Voluntary Standards - Issues, Techniques, and Consequences.
Final rept.,
David A. Swankin. Nov 81, 92p NBS-GCR-81-347

The report provides an overview of the needs, practices and consequences of providing rationale statements for voluntary standards. The research consisted of a literature review, a review of relevant court cases, the collection and assessment of examples of rationale statements, and discussions with those involved in standards writing. Six examples of rationale are analyzed and a discussion of the most controversial issues associated with rationale statements follows. The report also contains a listing of product liability cases in which the issue of standards was raised and analyzes the legal consequences that rationale statements are likely to have on such cases.

Consumer Representation in Standards Development: Literature Review and Issue Identification.
Final rept.,
Maureen A. Breitenberg, and Robert G. Atkins. Sep 81, 79p NBSIR-81-2336
Sponsored in part by Food and Drug Administration, Silver Spring, MD. Bureau of Medical Devices.

The report identifies for possible future study the major issues associated with the topic of consumer representation in the development of voluntary standards. The key terms (consumer and consumer representative) used in the report are defined, and background information on the Food and Drug Administration's medical device standards program is given. The report discusses important recent developments in consumer involvement in government and standards organization decisionmaking, and contains a review of Federal public participation programs. The literature on consumer representation is reviewed from the perspective of standards-developing groups and consumer organizations and the most salient documents are annotated. Based upon the available literature, supplemented by information obtained from personal contacts with affected parties, the major outstanding issues are summarized.

Farm Sector Application of Flow-of-Funds Accounting.
Staff rept.,
Richard W. Simunek. Nov 81, 44p AGES-811110

This paper assesses the impact of existing financial data gaps and specifies future data collection priorities that will substantially improve farm financial analysis. Development of farm sector financial accounting has been hampered by a lack of an understanding of Flow-of-Funds (FOF) objectives at the national level and the intermingling of FOF concepts with National Income and Product (NIPA) accounting concepts at the sector level. In addition, lack of documentation of data sources and data estimation methodologies has blurred the issue of data quality and in turn retarded both the development of improved data collection procedures and farm sector accounts.

Twenty-Five Innovations from Abroad.
1980, 50p NSF/RA-800597
Grant NSF-ISP78-01818

This survey of service delivery improvement ideas from around the world focuses on the dynamics of the transfer process without attempting a technical analysis of the pros and cons of each idea. Where a language barrier or the need for lengthy correspondence with foreign countries is involved, the likelihood of successful transfer diminishes. When someone in the United States is already working with an idea as a licensee, distributor, or colleague, chances for transfer improve dramatically. This handbook describes 25 ideas at a particular stage in the transfer process. The attempt is to ferret out the essential elements and commonalities for the international idea exchange mechanism using specific case histories. For each innovation the following is noted: problem addressed, solution, source, benefits, transfer, and contact. Topics covered include cost savings, energy, handicapped and elderly service delivery, housing, information exchange, traffic management/transportation, urban aesthetics/environment, and waste management.

Coalition of Northeast Municipalities, Boston, MA.
Forecasting Municipal Revenues and Expenditures: A Primer and Handbook,
Roy Bahl, and William Montrone. Jan 80, 23p HUD-0002061
Contract HUD-H-4434
Prepared in cooperation with Maxwell School of Citizenship and Public Affairs, Syracuse, NY. Metropolitan Studies Program. Sponsored in part by National Science Foundation, Washington, DC.

This handbook is designed to assist Northeast municipal governments with fiscal planning, specifically, forecasting municipal revenues and expenditures. The handbook's first part provides extensive background on forecasting and includes sections on the purposes and uses of fiscal forecasting, forecasting practices, and the administrative framework for forecasting. The second part describes a simple forecasting model which can be used locally without expensive equipment or prohibitively large staff assignments. Forecasting is used mainly for annual budget preparation to determine where a gap may exist between revenues and expenditures and to assess the impact of a policy or exogenous change in the budgetary situation. Methods used in forecasting are of four types: best guess or expert judgment, trend techniques, deterministic forecasts, and statistical forecasts. The handbook notes that it is advantageous to locate the organizational responsibility for preparing the forecast in the budget or finance department. The forecasting model uses a public employment approach, with aggregate spending forecasts following from assumptions about the level of governmental employees which a municipality will use and the prices paid for these services. A process is also offered for predicting future levels of intergovernmental aid. Figures and worksheets are included. (Author abstract modified).

Let's Make a Deal or On the Way to Public - Private Partnerships,
Nicholas P. Retsinas. Sep 80, 22p HUD-0002062
Contract HUD-H-4435

Geared to mayors and managers, this handbook is designed to assist these officials when they negotiate with the private sector to implement economic development activities. The guide outlines situations and tactics which give an overview of the context of economic development. An economic analysis of a community is the first step in devising an economic development strategy. Local officials should focus on identifying those factors which can make their community attractive to the type of private sector investments that best address their econnomic goals. A clear understanding of the economic base should suggest specific economic development objectives (e.g., an enhanced tax base or job creation), to be ranked according to importance. Thus, when officials negotiate with the private sector they will be able to determine which of these objectives a particular project will achieve. Tools available to local government to attract the desired private sector involvement are zoning and permits, location of public facilities, tax incentives, public procurement, and bonding (tax increment financing). Techniques to help a city initiate a partnership with the private sector include open solicitation (marketing) to restricted contracts. The negotiation process itself is discussed, giving suggestions for using the negotiating team, setting the tone, and preparing for compromise. Once a project is agreed upon, staff followup and monitoring are essential. A bibliography contains 11 references and an appendix lists municipal economic development resources.

Municipal Finance Officers Association of United States and Canada, Washington, DC. Government Finance Research Center.
New Initiatives in Financial Management Capacity Sharing: The Municipal Finance Officers' Perspective.
Feb 81, 86p HUD-0002067
Grant HUD-H-5390SG

This report describes the activities of the Government Finance Research Center (GFRC) of the Municipal Finance Officers Association as it reassessed and updated information on the financial management improvement needs of finance officers from around the Nation. This reassessment was undertaken for HUD's Government Capacity Building Division. The project was begun in December 1980 and concluded with HUD's National Priority - Setting Conference in Washington, D.C. in February 1981. The GFRC's project included conducting two needs assessment workshops with elected and appointed finance officials representing jurisdictions on all sizes from around the Nation. The workshops and other activities resulted in problem statements in several areas, including three identified by HUD: information needs in negotiating with the private sector; planning, managing, and maintaining capital infrastructure; and managing energy consumption and supply at the local level. Workshop participants noted that many of these problems are caused by financial problems such as an inability to enter the bond market or lack of knowledge of alternative financing sources. The needs for better training for all employees and elected officials and for better communication with taxpayers and the media were noted. Other needs are the creation of a talent bank which local governments could tap and information systems for such purposes as monitoring energy consumption and knowing the status of a jurisdiction's capital infrastructure. Detailed statements of each identified problem are provided, and include information on symptoms, level of importance, range of local situations prone to the problem, causes, responsibility, constraints, potential solutions, existing sources of assistance, and programmatic responses. Appendices provide a list of workshop participants, a bibliography, and the format for problem statements.

Consortium for Public Administration Field Services, Pittsburgh, PA.
Consortium for Public Administration Field Services: The First Two Years.
Nov 80, 45p HUD-0002086
Contract HUD-H-2693

The Consortium of Public Administration Field Services was formed by three universities to demonstrate that their graduate schools could provide practical assistance to groups of local governments or to individual units to enable them to increase their management capacity. The first 2 years of activity for the consortium are reported on. The consortium was created by the graduate schools of public administration and affairs of the University of Pittsburgh, West Virginia University, and Carnegie - Mellon University early in 1978. Teams of faculty and students provided management assistance to over 50 small, diverse communities in southwestern Pennsylvania, northern West Virginia, and southeastern Ohio. Small government units in these areas are experiencing severe pressures because the outmigration of industry and population has coincided with demands for new services and for the more efficient use of decliing resources. The consortium's demonstration program included direct assistance to communities and dissemination of results of individual assistance projects to other communities in the region and to other regions and schools of public administration and affairs. Projects have included improving cash management systems, developing an inexpensive approach to codifying ordinances, initiating risk management programs, and placing student interns in local governments to demonstrate the benefits of professional managers. The program has helped communities meet their management needs, has provided practical research and internship opportunities for faculty and students, and has initiated interest in undertaking similar projects in other communities and schools. Consortium project activities are planned for 2 more

years. Descriptions of the project's background, organization, operating process, and results of 33 finished projects are provided, along with a map and list of project locations and participants.

Training in Local Government Financial Management Practices. A Supplement to Volume V Trainer's Resource Service (TRS) Catalog of Resources.
Dec 80, 45p HUD-0002110
Grant HUD-H-5162RG

This manual lists training programs and materials on local government financial management practices and provides an update to 'Training in Local Government Financial Management Practices,' which included annotations of over 200 information sources on this topic. The supplement should be a useful reference for elected and appointed officials, financial managers, and technical assistance providers. The manual covers accounting, auditing, and financial reporting; computer applications; financial management; purchasing; revenue and expenditure forecasting; risk management; and tax assessment. Within each category, descriptions of training resources appear in alphabetical order by sponsoring organization. Each item listed includes the sponsoring organization's address and telephone number, the name of the resource, type of resource (workshop, seminar, handbook, manual, curriculum package, or self - study course), length of program, and a brief summary. Summaries include the following information whenever possible: objectives of the program, content covered, target audience, and unique features. Resources that address issues of more than one category are cross - referenced in other categories. (Author abstract modified).

Grantee Budgeting for Federal and State Aid, Part 1: General Findings and Policy Options,
Jesse Burkhead. May 81, 90p HUD-0002115
Grant HUD-H-5140RG

This report presents the findings and policy options of a study of local government's grantee budgeting for Federal and State aid and maintains that emphasis on improved budget classification would result in better budget policy. Two study approaches were used examinations of budgeting, financial management organization, and financial reporting in New York and Pennsylvania and in two counties and cities of each of these States; and extensive interviews in each of the jurisdictions. The study found that very great changes have occurred in the U.S. intergovernmental system over the last 25 years with budgetary fragmentation being the result. Both State and local jurisdiction grants are frequently off - budget (not included in the closed accounts or revenue estimates for the budget year), and jurisdictions' budget and financial accounts are becoming increasingly nonuniform. These factors impair the credibility of the budget as a document and interfere with legislative review. Several policy options could help correct the situation. These include local government use of additional Federal assistance through the extension of HUD's Financial Management Capacity Sharing Program (FMCSP), the expansion of the Intergovernmental Personnel Act of 1970, and mandated improvements in budget classification for grants - in - aid. Other options are the development of uniform State accounting standards and the use of resource organizations such as the National Governor's Conference and the National Association of State Budget Officers. Footnotes and nine tables are given.

Grantee Budgeting for Federal and State Aid, Part 2: Jurisdictional Practices,
Jesse Burkhead. May 81, 124p HUD-0002116
Contract HUD-H-5140RG

This report examines budget and financial management organization and grantee budget and financial reporting in New York and Pennsylvania and in two counties and two cities in each of these States. The narratives that compose this report reflect an examination of budgets, budget manuals, constitutions, statutes, municipal charters, and a variety of financial reports. New York State's government is both centralized and decentralized in organization for grantsmanship, has centralized control over capital projects that involve Federal assistance, and has a budget that includes both summary and department and agency classifications that reflect Federal funding. Pennsylvania has moved toward a stronger executive budget system in recent years, has State government with a decentralized grantsmanship pattern, and has very little State supervision of the budgeting and financial management responsibilities of municipalities. Narratives are also provided for the New York counties of Onondaga and Monroe and for the cities of Syracuse and Rochester as well as for the Pennsylvania counties of Lehigh and Dauphin and the cities of Allentown and Harrisburg. Figures, footnotes, and tabular data are included.

Joint Center for Political Studies, Washington, DC.
Management Improvement Needs of Disadvantaged Communities.
19 May 81, 120p HUD-0002117
Grant HUD-H-5389SG

This report describes the Joint Center for Political Studies' objectives, products, and overall role in reassessing and updating the management improvement needs of local government officials. In 1978, the Financial Management Capacity Sharing Program (FMCSP) of HUD's Office of Policy Development and Research adopted a process of listening to local officials' analyses of their management problems and needs and of responding with the kinds of assistance these officials said would help them. The resulting program has brought HUD, hundreds of local governments, and organizations that assist them into networks that cooperate by sharing information through workshops, regional conferences, a resource center, intra - State networks, peer match assistance, publications, and other efforts. These activities were a first response to a needs assessment in which more than 1,000 officials worked together to define the priority financial management needs of local governments. In November 1980, HUD's FMCSP staff asked local officials to reassess their management improvement needs and, in particular, to say if there were priority problems to be addressed in three areas that had been most frequently mentioned in these conversations: (1) information needs in negotiating with the private sector; (2) planning, managing, and maintaining capital infrastructure; and (3) managing energy consumption and supply at the local level. Seven organizations serving local governments sponsored workshops and other activities that identified problems in these three areas and others. The report contains 2 tables and 13 exhibits, along with a survey form and survey results. (Author abstract modified).

International City Management Association, Washington, DC.
Management Improvement Needs of Local Manager Governments: A Final Report.
Jun 81, 69p HUD-0002118
Grant HUD-H-5386SG

This report describes the activities of the International City Management Association (ICMA) in assessing and updating the financial management needs of local government officials. To carry out the needs assessment, ICMA assembled resource materials on three previously identified problem areas (negotiating with the private sector, managing capital infrastructure, and managing energy needs). ICMA also conducted two workshop sessions, solicited comments from a sample of ICMA members, reviewed the results of a previously conducted ICMA energy management survey, and developed a problem statement for each of the areas. A total of 91 city managers and assistants participated, while an additional 36 local officials were surveyed in a prior energy management needs assessment. The needs assessment findings revealed that the capital infrastructure issue was of the highest priority, while managing energy needs and negotiating with the private sector were of equal importance, but not as important as the infrastructure issue. Energy issues identified as important included the inability to identify and prioritize energy problems, the conflicting information about what can or should be done in energy management by local governments, and the difficulty in determining the allocation of financial resources for energy management. In addition, participants said they lacked understanding about how business decisions are made and what the community can and should do on behalf of existing or prospective business. Workshops, small group seminars, and 'peer - matches' were suggested as effective capacity sharing techniques. Footnotes and appendices, including an annotated bibliography of seven references, are supplied. (Author abstract modified).

Data on Small Business--Much is Collected but it Should be Integrated for Better Use.
16 Jul 81, 11p Rept no. GAO/AFMD-81-71

Virtually all officials we met with at Federal data gathering agencies and the Small Business Administration recognized the need for a small business data base. In our opinion, data gathering, analysis, and dissemination is a valid and important role for the Federal Government. Unquestionably, a wealth of information exists and is routinely gathered, but is not fully used due to legal and technical problems. The issues of confidentiality and access are being addressed through pending legislative proposals. We believe legislation will be needed to make federally collected data on small businesses more useful for policy analysis while ensuring confidentiality. The technical problems associated with coverage, comparability, errors, and timing are well recognized among the data gathering agencies, SBA, the Office of Federal Statistical Policy and Standards, and OMB. While many of the problems can be overcome, agencies are constrained by limited resources. (Author)

Systems Are Not Solutions: Issues in Creating Information Systems That Account for the Human Organization.
Interim rept.,
Philip H. Mirvis, and Edward E. Lawler, III . Jun 81, 39p 81-6(12), 2, AD-E001 184
Contracts N00014-81-K-0048, N00014-78-C-0609
Prepared in cooperation with Boston Univ., MA. Center for Applied Social Science.

The results of two action research projects are reported. Both focus on changing the information systems in organizations. One involved public reporting of measure, the other use of measures for feedback purposes within the organization. In neither case did the changes in the information systems have the expected results. The implications of this for changes in organizations are considered and the point is made that systems are not solutions although sometimes they can aid in finding them.

Records Filing, Maintenance and Disposition Study for Department of the Army.
Final rept. 1 Oct 80-30 Sep 81,
John R. Maher. 30 Sep 81, 104p
Contract MDA903-80-C-0721
Includes a Literature Search dated 17 Apr 81.

This report is in Staff Study format with a short management summary preceding the main study. The body of the study covers only the main points and ideas. Development is contained in tabbed appendices. The Army Functional File System (TAFFS) is institutionalized in Army Regulations 340-1 and 340-18-1 thru 340-18-16. It was developed in the later 1950's; implemented in 1963; and received major refinement in 1969. It replaced a subject file system with functional system which included a comprehensive disposition system. The development of office technology eroded the usefulness of TAFFS although a manual file system must be the mainstay of the Army of years to come. The Study infers that TAFFS should be replaced because it (1) does not lend itself to automation; (2) possesses major flaws in its management support characteristics; and (3) is not a good wartime system. Army Records Management Officials do not fully agree with this assessment. The Contractor suggests that in replacing TAFFS the Army should position itself to adopt such state-of-the-art developments as it finds useful and cost effective and install a simpler more management oriented manual system for immediate interim use. To accomplish this, Calculon maintains that a first order of business is to develop a simpler information classification system. A subjective or functional subjective system which eliminated the complexity of TAFFS is advisable. The Contractor recommends testing over 18 months two groups of subsystems and concepts. One is a conservative test based on a simplified TAFFS; and, the other is innovative, based on a long standing Army subjective classification system used to classify and number Army regulations.

Veterans Administration's Efforts to Improve the Management of Paper Records in the Department of Veterans Benefits. A Major System Acquisition Project.
30 Jun 81, 9p Rept no. GAO/HRD-81-106

This effort is DVB's Micrographics and Automated Retrieval Systems (MARS) project, which is being conducted as a major system acquisition pursuant to the Office of Management and Budget (OMB) Circular A-109--a uniform, executive branch procurement policy. DVB's MARS project, estimated in 1980 to cost $26 million over 8 years, has not progressed sufficiently to permit a complete assessment. Further, there is considerable doubt regarding the future of the project because of fiscal year 1982 budget cuts. DVB's current efforts are to convert only loan guaranty files to micrographics. Loan guaranty files are a small portion (3.2 million files) of DVB's total active record holdings (19.2 million files). DVB does not intend to study the need to convert its remaining record holdings until micrographic centers have been established for the loan guaranty files.

Preliminary Internal Data Screening - a Component of Quantitative Data Analysis in Data Validation.
D. J. Pack. Sep 81, 35p ORNL/CSD-85
Contract W-7405-ENG-26

Internal data screening is validation of data by quantitative internal comparisons across records for a given variable, across variables for a given record, across time for a given variable and record, etc. Preliminary internal data screening has the objectives of producing 1) a frozen, archived data base ready for efficient computer analysis and 2) a general understanding of key variables, a rough cut at response meaningfulness, a qualification of the type of error present, and an assessment of the expected level of difficulty in the comprehensive validation. The relatively less important first objective is defined. It is seen to be achievable through simple computer methodology. The second objective is the paper's major focus. Initial methodological suggestions for accomplishing this objective centering upon the exploratory data analysis techniques of Tukey are made, recognizing these techniques appropriateness for a general examination of a large data base that may contain numerous errors. (ERA citation 06:035776)

Efficient Access of Compressed Data.
S. J. Eggers, and A. Shoshani. Jun 80, 22p CONF-801009-2
Contract W-7405-ENG-48
International conference on very large data bases, Montreal, Canada, 1 Oct 1980.

A compression technique is presented that allows a high degree of compression but requires only logarithmic access time. The technique is a constant suppression scheme, and is most applicable to stable databases whose distribution of constants is fairly clustered. Furthermore, the repeated use of the technique permits the suppression of a multiple number of different constants. Of particular interest is the application of the constant suppression technique to databases the composite key of which is made up of an incomplete cross product of several attribute domains. The scheme for compressing the full cross product composite key is well known. This paper, however, also handles the general, incomplete case by applying the constant suppression technique in conjunction with a composite key suppression scheme. (ERA citation 05:034459)

The Information User in the Construction Industry - A Study of the Educational Need and Provision,
Michael Munday. Aug 81, 25p
Also pub. as Conseil International du Batiment pour la Recherche l'Etude et la Documentation, Rotterdam (Netherlands) CIB Working Commission Paper W 57/73/81/09/24. Presented at the Annual General Assembly of CIB Working Commission W 57 (7th), 'Building Documentation and Information Transfer' held at Vienna, Austria on 23-25 September 1981.

There is as yet very little measured and costed evidence of the practical benefits that would accrue to an Industry in which users had a high level of understanding and ability in information management and in which the support role of 'Information Manager' was acknowledged. There is, however, ample record that information handling occupies a high percentage of production time, and that authoritative views put poor performance in this field at the root of many of the Industry's problems. Such problems fall into two main categories. The first relates to buildings themselves and concerns physical (collapse, fire, leaks, condensation etc.) and spatial (short life, tight fit, high energy, etc.) failure. The second category concerns organizational failures. Clearly improvements in both these categories could be beneficial. Excessive waste, high costs, abnormal time, needless repetition and debilitating litigation could well be reduced and inter-user relationships, at both the personal and organizational levels, strengthened. They could also mean something more than a higher level of efficiency and a reduction in costs; improved standards in the quality of design and construction, and greater job satisfaction could also result. These claims are often judged extravagant, yet the underlying cause is rarely disputed. Users are generally conditioned to regard information as being nonproductive, simply a means to an end, and stereotyped attitudes are often set up, becoming barriers to improvement. Improvements in the management of information using better procedures, relevant aids and improved human performance may well result in changes in organizational structures but the users involved in these new patterns and relationships and in the procedures which accompany them will still need to know how to manage information and have the ability to do so. Similarly developments in the role of Information Managers are likely only to happen when the user population has a better understanding of information problem. Information-based problems will lessen only if the skills and understanding are there and used.

Recent Research Reports, Entries 1320-1540: Bibliography.
1981, 120p NSF-81-68, NSF/PRM-81001
See also Entries 1175-1317, PB81-174575.

This report contains 220 abstracts of recent technical reports, journal articles, and other documents resulting from research programs supported by the National Science Foundation (NSF). The primary purpose of this directory is to apprise the scientific and technical community of current research in the following areas: environmental biology; information science and technology; physiology, cellular, and molecular biology; social and economic sciences; chemical and process engineering; civil and environmental engineering; electrical, computer, and systems engineering; mechanical engineering and applied mechanics; industrial science and technological innovation; policy research and analysis; intergovernmental and public service science and technology; and international programs. Each citation includes the NSF report number, entry number, title, performing organization, author, award number, publication date, pagination, availability information, and an abstract. The NSF was reorganized to broaden the agency's capacity to support basic and applied research in the sciences and engineering and to give new emphasis to engineering research. The new organization to the division level is depicted in the appendix. Included in the directory is an entry index to previous issues; indices for report and grant numbers; and an author, subject, and performing organization index.

Lesotho Agricultural Sector Analysis Project, Maseru.
Catalog of Holdings and Other References in the Lesotho MOA/LASA Library.
Research rept.,
Gene C. Wilken, Matsaba J. Leballo, Betty J. Eckert, and Makhothatsa Motleleng. Feb 80, 375p LASA/RR-5, AID-PN-AAH-529
Prepared in cooperation with Colorado State Univ., Fort Collins. Dept. of Economics.

In 1978 the Lesotho Agricultural Sector Analysis (LASA) project team compiled a bibliography listing reference materials on agricultural planning and development in Lesotho which were held in collections in the United States, Europe and Africa. Since that time, the acquisition efforts of the LASA project team have focused on obtaining materials from Lesotho, such as national and ministerial documents and technical and statistical reports, as well as project papers, data analyses, and related consultant reports reflecting indigenous research and development activities. This second bibliography represents the collection of the LASA library, which has recently merged with that of Lesotho's Ministry of Agriculture. This combined collection contains the most complete and accessible agricultural and development planning materials and project documents in Lesotho. The bibliography contains nearly 3,000 entries (1841-1979) of English, Italian, Sesuto, German, French, and Spanish publications, and is organized into the following subject categories: georgraphy and natural resources; agriculture; agricultural marketing; industry and commerce; population, employment, and migration; education, training, and extension; health and nutrition; society, culture, and the political process; Lesotho planning and development assistance; and theory and methodology.

Methods for Evaluating Costs of Automated Hospital Information Systems.
Research summary series,
Erica Drazen, and Jane Metzger. Jul 81, 56p
NCHSR-81-171, DHHS/PUB/PHS-81-3283
Contract PHS-233-79-3000
See also PB80-178593.

Sponsored by the National Center for Health Services Research, this study was conducted to critique methodologies for assessing the cost impacts of automated hospital information systems (AHIS). Research done in these studies to the identification, prediction or measurement, and analytical treatment of specific cost impacts are compared and their adequacy and validity assessed. Conclusions are drawn about the current state of the art of assessing AHIS cost impacts. Recommendations are made concerning the best available techniques. Further research is also recommended in the improvement of specific cost assessment methods and in the development of better information on the influence of automated information handling on hospital costs.

The Subject Access Problem - Opportunities for Solution: A Workshop Held at Springfield, Virginia on 18-20 October, 1978.
Final rept. 16 Sep 77-31 Mar 79.
6 Sep 79, 84p
Grants NSF-DSI75-14876, NSF-DSI77-19588

The need to improve the ability of the user to find needed information through subject access was the basis for the workshop. The Committee organized the workshop to: (1) highlight the role of subject access with the emphasis on the needs of the information seeker, (2) compare techniques for subject access now being used in the library and abstracting and indexing (A&I) communities including applicable research efforts, (3) emphasize the role and nature of authority files in subject access control and facilitation, (4) seek opportunities to (a) improve information preparation for subject access through better functional interconnection and integration across all communities and (b) promote the use and enhance techniques for subject to classes of publications not now adequately covered.

The Prevalence of Rape and Sexual Assault.
Final rept.,
Diana E. H. Russell. Aug 79, 45p NIMH-81-46
Grant PHS-R01-MH-28960

The prevalence of rape and sexual assault among adult women was estimated by interviewing 932 San Francisco women. Reliable rates of prevalence and incidence were not obtained due to the difficulty in obtaining a true random sample. The database is of considerable interest and represents a body of data on rare events where there is no other reliable material.

A Systematic Management Approach Is Needed for Congressional Reporting Requirements.
Report to the Congress.
25 Nov 81, 57p PAD-82-12

The Congress levies reporting requirements on Federal agencies and others to obtain information on Government programs and activities. In fiscal year 1980, 2,680 reporting requirements produced approximately 4,000 reports at a reported cost exceeding $80 million. These reporting requirements are not being managed in a way that achieves the objectives for which they were created. They are managed by several organizations acting independently of each other with little or no coordination among them. As a result, performance of tasks overlaps and functional and informational gaps exist.

Methodology for Collecting Data.
19 Aug 80, 56p HUD-0001707
Contract HUD-H-5115

This methodology report for HUD provides a project overview, reference document research methodology, results of a document search, interviewing methodology, and organization of data. The project is designed to

obtain and organize information on all sources of data concerning the physical characteristics of housing found in HUD and FTC and to create a data base management system. The primary sources of data are narrative and standardized forms and project summaries developed by HUD, the Federal Trade Commission (FTC), and their contractors for research and operational purposes. The report's research methodology section covers the collection of documents, the HUD USER database, forms, identification of prime interviewees; a list of HUD Policy and Development contracts and interviewees; and a list of FTC systems and interviewees. and the analysis of documents (phases I, II, and III). In addition, the results of the document search are outlined, including a list of sources; references; a list of programs and interviewees; a list of program evaluations and interviewees. The interviewing methodology contains an introductory letter and a questionnaire, and two appendices list external sources and forms.

Software Technology Transfer and Export Control.
Rept. for Dec 79-Oct 80,
Seymour E. Goodman, Norman S. Glick, William K. McHenry, John B. McLean, and Claude E. Walston. Jan 81, 142p IDA-N-878, IDA/HQ-81-23408, AD-E500 419
Contract MDA903-79-C-0018

The formulation of a reasonable and effective export control policy for software products and software engineering know-how has been an important and difficult task for both the U.S. Government and industry. This note represents the contribution of the Software Subgroup of Technical Working Group 7 (Computers) to the development of a technical policy for the control of software. The note attempts to provide useful discussions and analysis in three areas. The first examines why the problem of software control has been so difficult, and presents the rationale for a number of working hypotheses which underlie the approach taken for the entire study. The second examines, in some detail, the 'what' (know-how and operational capability) and 'how' (transfer mechanisms) of software technology transfer. The last section recommends several items for inclusion on the Militarily Critical Technologies List.

U.S. Laws and Regulations Applicable to Imports from Nonmarket Economies Could be Improved.
3 Sep 81, 98p Rept no. GAO/ID-81-35
Report to the Congress.

For political and economic reasons, the United States trades with countries whose economic systems, unlike ours, are under centralized government control. Because of these differences, U.S. laws designed to protect domestic industry from unfair or disruptive imports are difficult to apply to these nonmarket, principally Communist, countries. This report discusses how these laws and their implementing regulations could be improved to make them more effective and easier to administer while protecting domestic industries.

Potential Impediment of Foundry Capacity Relative to National Defense Needs.
15 Sep 81, 20p Rept no. GAO/EMD-81-134

Foundries, which produce castings by pouring molten metal into a mold, are one of the Nation's most basic industries. As the fifth largest manufacturing industry, it produces 15 to 20 million tons of castings annually at a value of more than $21 billion. These castings provide critical components in aircraft, automotive, construction, energy, military equipment, and railroad industries and are found in 90 percent of U.S. manufactured items. Foundries, 97 percent of which are small businesses employing less than 250 people, employ more than 420,000 people and are located in all 50 States. Despite this key position, the number of foundries has declined by 1,479 since 1957 at a fairly steady rate, leaving the United States with 4,279 foundries in September 1980. Most of these were relatively small sized foundries; however, within the past year a significant number of larger automotive and other foundries have closed. The effect of closures on domestic capacity and specifically surge capacity is a significant area of concern.

The Comptroller of the Currency Should Decide the Extent to Which His Action Control System is Needed.
28 Sep 81, 6p Rept no. GAO/GGD-81-93

This letter is one result of our study of changes in bank supervision since 1976. The objective of that study is to see if banking supervision has improved in the last 5 years. Because quality supervision requires current and accurate information, we assessed the banking supervisory agencies' efforts to obtain and use better information on banks. Our analysis of the information that agencies are receiving led us to the Comptroller of the Currency's (OCC) ACS (Action Control System). First, our overall study of supervisory changes included a sample of cases of banks requiring special supervisory attention. We selected these cases to assess how the banking supervisory agencies are dealing with bank problems. At OCC we determined how ACS was used. We also discussed the system with OCC headquarters and regional officials. In addition, we studied documents prepared by OCC staff which described and evaluated the system. Despite its laudable goal of monitoring banks of special concern to OCC, ACS has not been used to the extent originally envisioned. ACS was designed to give OCC a fast communication link so it could take quicker and more uniform action against banks of concern than it could previously. The OCC committee studying ACS is not going far enough. It is trying to improve ACS' usefulness by redesigning its format. However, it is not addressing the question of extent to which ACS is needed to solve the perceived problem. Although a need for a standardized monitoring system may exist, ACS may not be the right system to fulfill that need.

HUD Should Strengthen Mortgagee Monitoring to Reduce Losses.
9 Jun 81, 25p Rept no. GAO/CED-81-108

Dept. of Housing and Urban Development-approved mortgage lenders--mortgagees--are responsible for originating and servicing HUD-insured single-family loads. If a mortgagee does not adequately assess the prospective home buyer's ability to repay a loan and/or does not provide proper servicing of the loan, defaults, foreclosures, and substantial losses to the Federal Government can occur. In fiscal year 1980, HUD sold 13,698 single-family homes that it had acquired after foreclosures at a loss of about $183 million--about $13,400 on the average for every property sold. Improved loan origination and servicing would reduce foreclosures and the Government's losses. GAO found that HUD needs to improve mortgagee monitoring by: (1) establishing more realistic mortgagee review goals; (2) concentrating on mortgagees that need monitoring the most; (3) providing more extensive review coverage; and (4) improving the quality and comprehensiveness of reviews.

The Role of the Armed Forces in the Mexican Economy in the 1980's.
Master's thesis,
Vicente E. P. Mendoza. Jun 81, 102p Rept no. NPS-54-81-006

It is common belief that expenditures for defense harm the economic growth of countries. Mexico presents a special case in this respect, because its expenditures on defense expressed as a percentage of its GNP, represent an average of 0.71% in the last thirty years. This thesis provides an awareness of the key role that the Armed Forces have played in Mexico's economic growth. Defense expenditures have not harmed economic growth. Rather, in fullfillment of their duties the Armed Forces produce a spin-off effect in the economy by supplying skilled manpower, education and training, and generating an aggregate demand. The Armed Forces can contribute to the achievement of National objectives without neglecting their military duties through programs of technology, employment, education and training, shipbuilding, food production and nursing, and social programs. Labor Market Projections Model: A User's Guide to the Population, Labor Force, and Unemployment Projections Model at Lawrence Berkeley Laboratory.
E. Schroeder. Aug 80, 69p
Contract W-7405-ENG-48

In an effort to assist SESA analysts and CETA prime sponsor planners in the development of labor-market information suitable to their annual plans, the Labor

Market Projections Model (LMPM) was initiated. The purpose of LMPM is to provide timely information on the demographic characteristics of local populations, labor supply, and unemployment. In particular, the model produces short-term projections of the distributions of population, labor force, and unemployment by age, sex, and race. LMPM was designed to carry out these projections at various geographic levels - counties, prime-sponsor areas, SMSAs, and states. While LMPM can project population distributions for areas without user input, the labor force and unemployment projections rely upon inputs from analysts or planners familiar with the economy of the area of interest. Thus, LMPM utilizes input from the SESA analysts. This User's Guide to LMPM was specifically written as an aid to SESA analysts and other users in improving their understanding of LMPM. The basic method of LMPM is a demographic cohort aging model that relies upon 1970 Census data. LMPM integrates data from several sources in order to produce current projections from the 1970 baseline for all the local areas of the nation. This User's Guide documents the procedures, data, and output of LMPM. 11 references. (ERA citation 05:033673)

Utility Solar Finance: Economic and Institutional Analysis.
E. Kahn, L. Ross, P. Benenson, and J. Cherry. Oct 79, 95p
Contract W-7405-ENG-48

Various forms of utility solar finance are analyzed. This analysis will delineate the complexity of the regulatory issues involved with any scheme which uses public utilities as financial intermediaries for on-site solar. The study begins with concrete examination of various types of utility solar financing arrangements. The focus is on the costs of each arrangement to the utility. The discussion then broadens to consider the generic economic impacts of utility solar finance on both the customer and the corporation. With this background, the broader social issues associated with utility involvement in the solar market are surveyed. The legal and regulatory concerns which would shape practical utility solar finance programs are delineated. The particular cost factors that determine economic viability of utility solar finance are examined in a detailed case study. Finally, the complex interactions of federal taxation and state regulatory practices are described. (ERA citation 05:006711)

The Cooperative Coal Marketing Arrangement in Eastern Kentucky: A Feasibility Report.
Final rept.
Jul 81, 48p ARC-78-89-6512

The feasibility and means of establishing cooperative marketing arrangements to enable small independent coal producers to gain access to large-volume, long-term markets and economies of scale are described in this report. Interviews revealed that small coal operators perceive their marketing problems as sufficiently real and serious to require adoption of new cooperative marketing practices and movement away from traditional, individualistic, practices. The physical criteria for establishment of cooperative arrangements in Eastern Kentucky are described and evaluated by county.

Revenue and Cost Allocations: Policy Means and Ends in the Railroad and Telecommunications Industries,
Robert Carson Godbey. c1979, 41p PUB-P-79-2

Increasing competition within the telecommunications industry is calling into question the present system of nationwide rate averaging and subsequent revenue pooling. The railroad industry, which similarly offers interstate service involving more than one company, has developed a technique of revenue distribution which establishes the rate for each route independently and provides for the subsidization of weak lines. The author describes the railroad industry's division of revenues and points out how differently problems common to both industries have been handled. He suggests that if the telecommunications environment comes to resemble that of the railroad industry, an understanding of the pros and cons of the railroad approach will assist the development of future telecommunications policy.

Ship Chartering Alternatives for Grain-Exporting Cooperatives.
Research rept.,
Donald E. Hirsch. Feb 81, 58p ACS/RR-2
Errata sheet inserted.

Sellers, including some farmer cooperatives, chartered vessels for shipping overseas nearly half of the U.S. grain exported in 1978. Chartering (leasing) offers opportunities for substantial increases in net gains, resulting from greater net margins on shipping and deeper penetration into the grain export marketing process, but also involves the risk of substantial losses. Most grain cooperatives do not have the volume, expertise, facilities, capital, and operating flexibility essential for successful chartering. This report recommends a course of action that would increase cooperatives' chartering capabilities and enhance their competitive position in the international grain trade.

Williams (Charles W.), Inc., Alexandria, VA.
Future Developments in the Food Industry: Probable Efforts at Vertical Integration by Food Retailers.
Jul 81, 78p FTC/OPP-81/07
See also PB82-132382.
Also available in set of 3 reports PC E13, PB82-132358.

The writer's basic proposition is that sociological bias and regulatory and social constraints placed on national, branded food processors will combine with several key trends to create vertical integration in the food industry in the 1990s. This vertical integration will be led by a combination of farmers and agricultural producers, possibly uniteing into a coalition, who will place increasing competitive pressure on national food processors. These processors will be required to find innovative marketing concepts or be pushed into an increasingly weaker position within the food industry. This report contains an introduction and an executive summary, a review of those factors which are expected to influence vertical integration, possible scenerios, and implications of interest to the FTC.

Future Developments in the Food Industry: Probable Emergence of Near Field Fermentation Conversion Centers.
Jul 81, 31p FTC/OPP-81/08
See also PB82-132366, and PB82-132374.
Also available in set of 3 reports PC E13, PB82-132358.

This paper outlines the concept of an evolving food processing technology, the system that technology will create, and the implications most significant to the FTC. While fermentation has been used in processing for thousands of years, these new, near field centers will introduce a number of fundamental changes to the technological and institutional structure of the food industry. This technology will operate as an integrated conversion process that will be a focal point of convergence across several traditional industrial boundaries, including: agriculture, food processing and manufacture, chemicals, pharmaceuticals and energy. This report includes an introduction and an executive summary; a scenario of the near field fermentation conversion center in operation; implications of such a system to the FTC; and a background of the driving forces from which such a system will evolve.

Development of Compatible State - SMSA Econometric Models.
Final rept.,
Carol A. Taylor, and Alberta H. Charney. 1981, 165p NSF/SES-81005
Grant NSF-DAR79-09489
See also PB82-133505.

The development of a state-substate compatible econometric model and its empirical application to the state of Arizona is described. The model is 'compatible' in the sense of yielding consistent forecasts for a state and a completely covering set of substate areas. It is a detailed econometric model of Arizona, its two Standard Metropolitan Statistical Areas (SMSAs), Phoenix and Tucson, and the aggregated non-metropolitan balance of the state. Designed for short-term forecasting, the model focuses on employment, population and labor force, income, and state-shared revenues. In addition, it estimates a variety of auxiliary variables used to forecast these primary variables. It contains 289 stochastically estimated equations which are solved by using the Gauss-Seidel technique. Three basic methodologies were examined for obtaining consistent state-substate estimates for any single model variable in the development of the Arizona model. Results of the study indicate that the model is accurate and compares well both with previous econometric models of the Arizona areas and with other regional models.

Energy Conservation and the Demand for Labor: Evidence from Aggregate Data.
Final rept. Oct 80-May 81,
Richard Morgenstern, and Wayne Vroman. May 81, 20p ASPER/PUR-81/1009/A
Contract DL-B-9-M-1-1009

The objective of this study was to explore the relationship between aggregate employment and output, with special reference to the 1979-1980 experience. An indirect relationship was posited between energy price shocks and the occupational mix. Specifically, it was hypothesized that the energy price shocks of 1978-1979 (and possibly 1973-1974) may have created new investment opportunities for simple, short term energy conservation type investments which may, in turn, have increased the demand for blue collar labor. A framework for viewing the problem is described and the basic hypothesis tested by estimating a time series model of occupational/industrial employment patterns. Included in the model is a set of variables designed to measure the energy price shocks.

A Study of Metric Conversion of Distilled Spirits Containers: A Policy and Planning Evaluation: Task I. Comprehensive Report on the Conversion Process,
James A. Simpson. 5 Aug 81, 187p
Contract DOC-AA-80-SAC-X8602
Sponsored in part by United States Metric Board, Arlington, VA.

Chapter I presents a brief overview of the distilled spirits industry in order to understand the context of events and issues addressed in later chapters. Chapter II analyzes the motivation phase, during which a consensus was reached within the industry that conversion was a desirable objective and should be pursued. Chapter III analyzes the planning phase, when the details of the conversion were discussed and decided upon by the parties involved. Chapter IV describes and analyzes the events, issues, and problems of the implementation phase of the conversion. In Chapter V, the costs and savings resulting from the conversion are analyzed. Chapter VI analyzes the impacts of the conversion on prices, and Chapter VII the impacts on consumption, profitability, industry structure, and size, product, and brand preferences. Chapter VIII summarizes the important findings and conclusions from the research. Lastly, an Appendix presents in chronological order the dates and descriptions of events and activities related to the conversion which were uncovered during the course of this research.

State Laws Relating to the Ownership of U.S. Land by Aliens and Business Entities.
Staff rept.,
Joseph W. Mayer. Nov 81, 64p AGES-811113

A significant number of States have laws directed at the ownership of U.S. land by aliens and business entities. These laws vary greatly from State-to-State in the degree of their severity. Thirty States have some type of law restricting alien ownership of land. Eight States require aliens to report their landholdings within the State. Thirteen States restrict business entities from owning land or engaging in the business of farming. Ten States have laws requiring business entities to report their landholdings within the State. An individual State may be included in more than one of the above categories.

In this report, results of the first part of a two-part study of the marketing of alcoholic beverages are presented. The overall objective of this report is to assist the National Institute on Alcohol Abuse and Alcoholism (NIAAA) in gaining a more complete understanding of the environment in which Americans purchase and consume alcoholic beverages. An introductory overview is provided, including details on how the study was conducted. The model of the marketing process is presented, and each of its components is detailed. The report concludes with a summarizing review of the model and a description of information sources on alcoholic beverage marketing. A selected bibliography is also provided.

Marketing Practices in the Alcoholic Beverages Industry: Toward an Understanding of How Macro-Environmental Forces Shape Marketing Strategies in the Alcoholic Beverage Industry. A Supplement to Phases I and II,
Paul N. Bloom. Sep 81, 24p RAC-4285, NIAAA/NCALI-81-22
Contract PHS-ADM-281-78-0020
See also Phase II, PB82-135278. Prepared in cooperation with Maryland Univ., College Park. Coll. of Business and Management.

A supplement to Phase I and II of a study designed to assist the National Institute on Alcohol Abuse and Alcoholism (NIAAA) in understanding both marketing practices and consumer purchasing of alcoholic beverages is presented. In this supplement, an attempt is made to point out the importance of understanding how industry marketing practices (both domestic and international) can be influenced by macro-environmental forces. A model of the alcoholic beverage industry and its external domestic and international environments is presented, and the role of political-legal, economic, sociocultural, and technological forces in the industry is described, including how these four forces might directly or indirectly affect the industry's marketing strategies. Some suggestions are offered on research priorities for addressing the various questions raised throughout the paper. Contents of the two main substantive reports (Phase I and II) are appended.

Also available in set of 3 reports PC E15, PB82-141813.

This document is one part of a three-part report profiling the medical technology industry using an industrial organization (I.O.) economics approach and secondary data sources. Volume I provides an in-depth description of the industry in terms of structure (concentration, barriers to entry, etc.); conduct (decision-making processes related to price, output, etc.); and performance (new patents, profits, etc.). It also provides an overview of government policies affecting the industry. In Volume II, the I.O. approach is applied in a case study of the effects of Medicare/Medicaid reimbursement and the 1976 Medical Device Amendments on the pacemaker industry. Appendix A provides an analysis of the adequacy and availability of the various aggregated, firm specific, and specialized data bases. Collectively the documents contribute to the identification of influences affecting innovation and the description of what has happened to firms entering or exiting the market and factors associated with survival. The application of the industrial organizational methodology was tested in a case study of the cardiac pacemaker industry. The limitations of using existing secondary data sources for such analyses are discussed in detail.

Structure, Operation, Performance, and Development Trends of the Mobile Home Industry. Volume II. The Mobile Home Production System,
Arthur D. Bernhardt, Kenneth A. McPherson, Peter H. Greenwood, Herbert B. Zien, and Charles B. Goldfarb. 15 Jul 76, 967p HUD-0001554
Contract HUD-H-1682

Part of a five - volume series on the structure, operation, performance, and development trends of the mobile home industry, this report examines supply sector influence, industrial organization, manufacturing, cost / price analysis, and manufacturer financing. An estimated 1,500 firms supply the mobile home industry. Results of Project Mobile Home Industry's survey of all known supplying firms showed that the modal firm in a sample of 188 suppliers had just 1 product, but over 10 percent had as many as 5. The report suggests that the mobile home industry has the potential to counteract elements of monopoly power that appear to exist in the supply sector. Historical constraints that have encouraged the current structure of the mobile home production system are discussed as well as the structure of the mobile home production system that leads to patterns of operation characterized by high levels of entry and exit.

Structure, Operation, Performance, and Development Trends of the Mobile Home Industry. Volume III: The Mobile Home Distribution System,
Arthur D. Bernhardt, Winston Chiong, Herbert B. Zien, Kenneth A. McPherson, and Ahmet C. Tekiner. 15 Jul 76, 775p HUD-0001555
Contract HUD-H-1682

Part of a five - volume series on the structure, operation, performance, and development trends of the mobile home industry, this report examines industrial organization, distribution, cost / price analysis, dealer financing, and consumer financing of the mobile home distribution system. Mobile home dealers, numbering 13,513 in 1974, are highly decentralized, and regional differentials in the number of outlets are substantial. Basic areas for improvement in the industrial organization are suboptimal spatial distribution of the existing outlets, excess capacity, and serious seasonal fluctuations. The average annual mobile home dealership sales volumes have risen from about $192,000 in 1963 to $895,000 in 1972. The distribution system has evolved from small, family - owned operations to large, incorporated dealerships. Most dealers have become sophisticated in the sales and servicing of mobile homes as "permanent" residential units.

Structure, Operation, Performance, and Development Trends of the Mobile Home Industry. Volume IV: The Mobile Home Park System,
Arthur D. Bernhardt, Michael Burrill, Herbert B. Zien, and Thomas R. Dibenedetto. 15 Jul 76, 706p HUD-0001556
Contract HUD-H-1682

Part of a five - volume series on the structure, operation, performance, and development trends of the mobile home industry, this report examines the mobile home park. Sections concern industrial organization of the mobile home park system, park development and operation, cost / price analysis, and park financing. The primary data base for this volume was developed from responses to a national survey by hundreds of mobile home park developers, traditional subdivision developers, onsite builders, and mobile home park owners and managers. The mobile home park provides the second vital component of the industry in addition to the housing unit - namely, the developed site with foundation and utilities. The performance of the park system directly determines the supply of developed land for placement of the mobile home.

Arthur D. Bernhardt, John M. Wallach, Frank H. Benesh, Linda S. Zack, and Norman Quon. 15 Jul 76, 672p HUD-0001557
Contract HUD-H-1682

Part of a five - volume series on the structure, operation, performance, and development trends of the mobile home industry, this report examines how land use controls, taxation, building codes, and highway regulations affect the industry. The report outlines exclusion and restriction methods in land use control, lists reasons for wide zoning practice variations, assesses the impact of land use controls on industry performance, and notes three trends in land use controls that may lead to market expansion. The impact of State taxation of mobile homes is reviewed, and the beneficial effects of realty taxation are outlined, such as market expansion, increased sales volume, and decrease unit cost for the mobile home industry. In addition, the report describes the efforts of the Mobile Home Manufacturers Association to build a nationwide, comprehensive performance code for the entire industry (American National Standards Institute (ANSI) Standard A119.1 for Mobile Homes) which is regularly amended by ANSI. Problems of State - by - State variations of A119.1 such as variations in inspection and lack of interstate reciprocity are discussed, and improvements suggested. Congressional legislation that preceded the adoption of Title VI of the 1974 Housing and Community Development Act is outlined, and the implications of Title VI for States, localities, and the mobile home industry are analyzed. The report also recommends improving three major forms of State regulation of mobile home highway movement dimension limitations, permit requirements, and traffic regulations specific to oversize vehicles. Graphs, maps, and tabular data are included. Footnotes and a table of contents are given for each section. The appendix contains a supply and demand model of mobile home rental and purchase markets; a report of New York and Pennsylvania experiences with the realty tax; 'fair share' taxation studies from California, Connecticut, and Georgia; the texts of Oklahoma and Kansas highway amgulations; and accounting sheets for highway regulation.

Assessing the Effects of the Section 8 Program Using the Urban Institute Housing Market Model,
Sue A. Marshall, and Gary S. Anderson. Feb 81, 69p HUD-0002047
Contract HUD-H-2162R

For housing policymakers, this paper examines how well the Urban Institute model can perform in analyzing housing policies such as the Section 8 program. The Urban Institute housing market model is one of several large - scale, computer - based statistical models developed in the late 1960's and early 1970's to simulate complex interactions in the housing market. Understanding the behavior of the various actors involved in market interactions is essential if housing policymakers hope to influence these interactions. To assess the model's usefulness as a tool for local policymakers, this paper evaluates the experiences of local agencies using the model for such analyses. The paper presents a brief general overview of the model and summarizes the results of Section 8 simulations using the model. It then describes the experience of local agencies attempting to use the model, focusing on two cases -- the Los Angeles Community Development Department (CDD) which unsuccessfully attempted to calibrate the model and the Canada Mortgage and Housing Corporation (CHMC) which applied the model to eight Canadian metropolitan areas. The paper also compares the Urban Institute model to two other housing market models, the National Bureau of Economic Research Urban Simulation Model and the Community Analysis Model. The major conclusion drawn from experiences with the Urban Institute model presented here is that the model is a viable tool for analysis of policies such as the Section 8 program. However, the model has not been documented in sufficient detail to allow users at the local level to complete the process without assistance from someone experienced with the model. Factors which differentiate the experiences of the CHMC and the CDD in applying the model (i.e., resources, staffing, and expectations) can serve as an indication of what makes it likely that a local jurisdiction will meet with success using the model. Tabular data, footnotes, and 22 references are included. A description of the Urban Institute model is appended. (Author abstract modified).

Relevance to HUD of Recent Scholarly Research in Urban Economics,
Stephen J. Carroll, Anthony H. Pascal, and Michael N. Caggiano. Sep 79, 102p RAND/N-1298-HUD, HUD-0002048
Contract HUD-H-2930

This report constitutes an experimental attempt to assess the recent scholarly literature in urban economics for its relevance to HUD's policy problems. Its purpose is to assist HUD officials responsible for the periodic review and revision of public finance and urban economic development research priorities. The report covers books by economists on urban subjects and articles which have appeared in professional journals since 1974. It introduces the topics on which policymakers concerned with urban finance and economic development issues require information. Such topics are the urban economy's base, the city's fiscal capacity, financial issues, and economic development problems. The report then describes the problems addressed by the economics literature since 1974 and compares the policymakers' topics of concern with subjects in the literature, identifying areas where the available research is particularly limited. Finally, the report notes deficiencies with respect to the volume of studies, their quality, and their direct policy relevance and discusses the kinds of research needed to fill important information gaps. Findings indicate that the 'city as an entity' was the most widely studied topic, followed by property taxes. The research on Federal policy was indicated to be wide - ranging but lacking in analytical features, while research on local government services was the best developed topic. Overall, the treatment of the economic base is inadequate from a policymaking standpoint, although the literature provides a theoretical context. Furthermore, the deficiencies identified in the extant literature suggest research priorities for HUD. Generally, HUD's objectives should be to promote the development of a better information base on urban finance and local economic development. Appendices present a quality ranking of journals and a bibliography listing books and articles on urban finance and economic development noted by the 'Journal of Economic Literature' between 1974 and 1978.

National League of Cities, Washington, DC.
Northeast Municipal Economic Development. A National League of Cities Study of Municipal Economic Development Needs, Capacities and Perceptions in the Northeast,
Holly Wallace. Sep 79, 15p HUD-0002059
Contract HUD-H-4435
Sponsored in part by the Department of Housing and Urban Development,Washington, DC. Office of Community Planning and Development.

Findings are reported from a National League of Cities survey of the organizational, programmatic, and budgetary capacities and perceptions regarding economic development of 40 Northeast municipal governments. Cities and towns in eight of the nine Northeast States completed the survey. A narrative description of the findings is provided, including comparisons with national findings, followed by detailed information from selected survey questions. Most responding cities have economic development departments with one or two staff members -- slighty fewer than the national average. However, they are much more likely to have hybrids of quasi - public economic development authorities, corporations, or councils, so that economic development is more institutionalized than in many parts of the country. Generally, Northeastern cities have made greater progress toward formally adopting economic development plans and strategies and implementing programs than have cities in other regions. Unlike the rest of the country, Northeastern cities believe property taxes, infrastructure maintenance, and bus and subway service are major facilitators of economic development, reflecting their concern about declining population, business, tax base, and employment. They are also stronger proponents of increased Federal aid for city economic development than are cities in other regions. The survey questionnaire is also provided.

Can Community Economic Development Meet the Fiscal Needs of Municipalities. Economic Growth and Fiscal Stress in Three Northeast Cities,
William Montrone. Sep 80, 66p HUD-0002060
Contract HUD-H-4435

The relationship between municipal fiscal condition and economic resurgence is examined in Boston, Mass., Hartford, Conn., and Portland, Maine. All three cities have, to some degree, experienced downtown revitalization, neighborhood development, and industrial expansion. Stimulated by innovative Federal development approaches -- notably, the Urban Development Action Grant and the Community Development Block Grant -- these local economic development efforts have often reversed the economic decline which has plagued the old fully developed communities of New England. The result of this economic stimulation has been a reduction in unemployment rates, an increase in wages, reuse of vacant industrial buildings, and renewal of blighted areas. The fiscal health of the local governments, however, has not kept pace with the economic development of the cities. Fiscal analysis shows increasing revenue shortfalls in all three cities in coming years. The shortfalls are generally due to (1) the inability of the city's property tax base to produce sufficient additional revenue growth, (2) the reduction in Federal and State assistance, and (3) the persistence of high inflation rates which erode the city's purchasing power. Recommendations for increasing revenues include property tax reform, linking the benefits of economic development with local government finance, and increasing State and Federal assistance. Other recommendations involve implementing cost controls and expanding revenues from such local revenue sources as licenses and permits, fines, sales of city property, interest on investments, and user fees. Tabular data are provided from each study, and notes are included.

Risk of Inner-City Mortgage Lending,
Robert Lindsay, David Listokin, Emanuel Tobier, and Alex S. Avitabile. Aug 79, 513p HUD-0002072
Grant HUD-H-2870RG

This study examines the nature of risk involved in mortgage lending in the inner city and explores public and private strategies for dealing with this risk, emphasizing case experiences in several cities and one State. The report begins with a discussion of the meaning and measure of mortgage risk and contrasts the internal cost flows of normal risk mortgage loans with the heightened costs of extra risk. The examination shows that it is both more difficult and more expensive to get the capital needed to grant urban loans. Moreover, even if capital can be secured, urban loan origination can be laborious, requiring extra servicing effort and expense; there is the further hazard of a higher incidence of loan delinquency / foreclosure and a larger loss per bad loan. While these hurdles exist, several case examples show that the problems of urban lending are not insurmountable and can be handled if appropriate strategies are followed. Four chapters analyze successful approaches involved in the Philadelphia Mortgage Plan, the CPC and Citibank strategies in New York City, the South Shore lending program in Chicago, and the Neighborhood Loan Program administered by the New Jersey Mortgage Finance Agency. An additional chapter summarizes and evaluates the strategies used by a large mutual savings bank in New York City to deal with the troubled portion of its multifamiy loan portfolio. Among potential government strategies for raising capital funds for urban lending are the issuance of tax exempt bonds to finance takeouts from private lenders with the proceeds and the selective depositing of public funds with those private financial institutions which have been most active in urban lending. Counseling and establishing a separate urban loan department are suggested approaches to facilitate originating urban loans. Ways to reduce loan servicing expenses include careful monitoring of loan status and reacting quickly when problems are detected. It is recommended that multiple strategies be used and that systemwide changes and effects be considered. Tables and chapter reference lists are provided.

Real Estate Closing Costs: Real Estate Settlement Procedures Act (RESPA), Section 14a. Volume I: Executive Summary.
Apr 81, 63p HUD-0002126
Contract HUD-H-2910

This study seeks to determine how well the settlement process is working and, specifically, how individual settlement service markets are performing to provide required services at a reasonable cost. The study also evaluates the effectiveness of the Real Estate Settlement Procedures Act of 1974 (RESPA) in achieving its objectives: informing the consumer, increasing the incidence of shopping, and ultimately lowering settlement costs where they are excessive. In addition, the study assesses the feasibility and desirability of modifications and alternatives to RESPA. Two principal research tools were used in addressing the study's objectives: a national survey of 18,000 Uniform Settlement Statements and a number of local market studies. The local market studies involved eight markets, including Boston, Mass.; Denver, Colo.; Jacksonville, Fla.; Los Angeles, Calif.; San Antonio, Tex.; and Seattle, Wash. In addition, more than 80 personal interviews were conducted with national, State, and local public officials and officers of relevant industry associations. Three interrelated components of RESPA were studied to assess the act's effectiveness: compliance / implementation, systems changes, and price impact. Results showed that the letter and intent of the RESPA provisions are, for the most part, being followed. Overall findings concerning all or several of the settlement service markets show that consumers are relatively uninformed about settlement services, competition exists primarily for referrals rather than for the consumer's business, and some provider practices exist that appear to add unnecessarily to settlement charges. In addition, the report discusses the performance of the brokerage industry, the mortgage lending industry, the private mortgage insurance industry, and the title assurance and conveyancing service industries; and the role of attorneys in settlement services. Alternatives related to improving the performance and services of these industries are detailed, along with suggestions for improving consumer information. Footnotes are provided.

Legislative and Regulatory Actions Needed to Deal with a Changing Domestic Telecommunications Industry.
24 Sep 81, 237p Rept no. GAO/CED-81-136
Report to the Congress.

This report assesses the Federal Communications Commission's program for regulating domestic telecommunications common carriers. The report makes several recommendations to the Congress and the Commission for improving the regulatory framework provided by the Communications Act of 1934. Rapid technological change has broken down the natural monopoly characteristics of the telecommunications industry and paved the way for a more competitive industry structure. One contributor to this change has been the development of alternative transmission technologies--point-to-point microwave, satellites, and coaxial cable--to the traditional technology of paired wires. The size of the market for telecommunications has also grown--reflecting the convergence of data processing and telecommunications--further dismantling the natural monopoly characteristics of the industry. New equipment has been developed to provide new services such as digital networks to meet computers' specialized data transmission needs. Reacting to this technological change, the Federal Communications Commission, supported by the courts, has over the past 20 years issued a number of decisions allowing competition into the manufacture of telecommunications terminal equipment and into the interstate provision of telecommunications services, which have altered the structure of the telecommunications industry.

Special Estate Tax Provisions for Farmers Should be Simplified to Achieve Fair Distribution of Benefits.
30 Sep 81, 100p Rept no. GAO/PAD-81-68

This report examines two provisions added to the Federal estate tax law by the Tax Reform Act of 1976 to help farm families retain farmland after the death of the owner. We made this review to determine whether the two special provisions have been effective in promoting the stated congressional objective of reducing the number of family farms sold to pay estate taxes. Information from this report was previously provided to your committees in the consideration of the Economic Recovery Tax Act of 1981. (Author)

Unresolved Issues Remain Concerning U.S. Participation in the International Energy Agency.
8 Sep 81, 137p Rept no. GAO/ID-81-38
Report by the Comptroller General.

The International Energy Agency (IEA), established in 1974 and composed of 21 oil consuming countries, is a multilateral organization designed to facilitate responses to short-term energy disruptions and long-term supply problems. IEA's Emergency Sharing System is the mechanism available to respond primarily to short-term supply interruptions. As IEA's principal proponent, the United States contributed 25 percent ($2.45 million) of the agency's budget for fiscal year 1981. The IEA serves as an energy policy coordinating forum for consuming nations. It has improved member countries' understanding of the oil market and provided them with a better sense of what needs to be done on an international and national level during a period of continuous supply uncertainty. The IEA's success in a rapidly changing market environment depends greatly on the willingness of participating countries to support its basic objectives of (1) sharing supplies in an emergency, (2) developing a comprehensive oil market information system, (3) establishing a long-term cooperation program emphasizing import controls and accelerated development and use of alternative fuels, and (4) improving consumer-producer relations. U.S. Role in Sinai Important to Mideast Peace.
9 Sep 81, 9p Rept no. GAO/ID-81-62

The United States has played a leading role in preserving the pease in the Sinai (the strategic peninsula directly adjacent to Israel's western border) since the 1973 war between Egypt and Israel. Through U.S. 'shuttle diplomacy,' Egyptian and Israeli forces were separated with buffer zones between them. Then in 1976, the United States established a civilian tactical early warning system in the strategic mountain passes of the Sinai to monitor adherence to the terms o the Sinai agreements. The United States, as a result of the current peace treaty between Israel and Egypt, will deploy armed forces in the Sinai as part of a multinational peacekeeping force to supervise implementation of the treaty. This deepening U.S. involvement in the Sinai is crucial to the peace process, but also raises serious issues for congressional consideration. (Author)

Saudi Perceptions of the International Environment,
William B. Quandt. 22 Sep 81, 4p FAR-211-GP

Saudi Arabia enters the 1980s with unprecedented wealth and international prestige. This does not, however, produce a sense of real power or security on the part of Saudi rulers. The reasons are several: In terms of population and military might, Saudi Arabia remains a small power by Middle East standards. Regional instability threatens Saudi Arabia directly and indirectly. The US-Saudi relationship, long relied upon by Saudi leaders to enhance the KIngdom's security, is being called into question. The Soviet Union is developing positions of strength around Saudi Arabia--Afghanistan, South Yemen, Ethiopia, as well as Libya and Syria.

Pakistan's Foreign Relations,
Shirin Tahir-Kheli. Oct 81, 6p FAR-212-GP
Prepared in cooperation with Temple Univ., Philadelphia, PA, and Foreign Policy Research Inst., Philadelphia, PA.

The 'Islamic connection' and relations with the People's Republic of China are the two constants of Pakistan's foreign policy. Historically, common perceptions of threat have been instrumental in bringing nations together, and so it is with the PRC and Pakistan which, since the 1960s, have shared their fear of India and the Soviet Union. The Indo-Soviet treaty of 1971 institutionalized the links between the two signatories and left little doubt in Islamabad and Beijing that parallel interests had brought Moscow and New Delhi into a treaty relationship.

Cooperative Extension Service's Mission and Federal Role Need Congressional Clarification.
21 Aug 81, 58p Rept no. GAO/CED-81-119
Report to the Congress.

The Cooperative Extension Service has expanded into new and more socially oriented programs from its original focus on agriculture and home economics programs in primarily rural areas. As demands for its services have increased, disagreements have arisen over what its mission should be. The U.S. Department of Agriculture's role in providing overall program leadership and guidance and in evaluating extension activities is also not clear. Because the Extension Service's resources are limited ($700 million in 1980) and demands for its services are increasing. GAO recommends that appropriate congressional committees examine the Cooperative Extension Service's mission, including the appropriate Federal role. (Author)

Inferred Referendum and Its Comparison with Borda Voting.
A. M. Wolsky, and L. P. Sanathanan. May 80, 40p
ANL/SPG-19
Contract W-31-109-ENG-38

A new amalgamation procedure or method of social choice, the inferred referendum, is presented and compared with Borda voting. The procedure has an unrestricted domain and satisfies the principles of unanimity, anonymity, and neutrality. The procedure agrees with majority voting, MMD, when MMD is transitive. When MMD is intransitive, the inferred referendum orders the alternatives through the solution of a constrained maximum-likelihood problem. This problem is the same as one would solve to infer the beliefs of a transitive population from a random sample. If, in fact, the decision makers represent a constituency, attention must also be given to a figure of merit whose value might indicate when to defer action based on the result of the inferred referendum. A different amalgamation procedure, Borda voting, is described as a simple example of a large class of natural procedures. Each of these procedures is shown to have two associated quantities that together generalize Kendall's coefficient of concordance, W; the relation of this coefficient to pairwise votes, and thus to MMD and Borda voting, is also described. A detailed comparison of Borda voting and the inferred referendum is given for the case of three alternatives. In that case, the procedure depends only on pairwise votes, where the two procedures differ is shown, the procedure violates Sen's property alpha less than does Borda's, and the maximum value of W for which MMD can be intransitive and the maximum value of W for which the inferred referendum, MMD, and Borda voting can differ are found. Agreement Governing the Activities of States on the Moon and Other Celestial Bodies.
E. D. Gaggero, and R. P. Ripoll. Sep 81, 35p NASA-TM-76730
Contract NASW-3541
Transl. Into English from Mcgill Univ. Ann. Of Air and Space Law (Canada), V. 5, 1980 p 449-480. Transl. By Kanner (Leo) Associates, Redwood City, Calif. Original DOC. Prep. By Montevideo Univ., Uruguay.

The treaty on the Moon is not revolutionary but it embodies the legal rule for future activities of man on the Moon as opposed to the Space Treaty of 1967 which was too general. The new text is conservative but still allows some room for the developing States as in the law of the sea. The Moon is declared the 'Common Heritage of Mankind' but the regime of exploitation of its resources is still blurred with imprecise guidelines still needing to be developed. The two superpowers cannot as in the past, ignore the rest of the world in the conquest of space and the fact that the U.N. is the depositary for ratifications, and not the two superpowers as in previous treaties, is the first sign of wider participation in the creation of Space Law.

An Analysis of the Scope of Federal Laws and Regulations Controlling Exposures to Substances Which Cause Occupational Respiratory and Pulmonary Diseases.
Final rept. Sep 78-Dec 79,
Philip Tabas, Gene E. Fax, and Michael B. Phillips. Dec 79, 108p ASPER/CON-78/0153/A
Contract DL-J-9-M-8-0153

This report presents the findings from a study of the scope of laws and regulations covering pulmonary and respiratory hazards. The analytic approach consisted of first developing a basic inventory of relevant regulated substances, then determining the range of toxic effects regulated, and finally identifying the range of work place settings covered by the regulations. Each substance listed in the inventory was assigned a hazard status and a regulatory status. No attempt was made to assess the enforcement or the degree of compliance with the laws and regulations. The analysis revealed that: (1) worker exposures to substances whose toxic effects are known to cause cancer and chronic respiratory illness are for the most part governed by regulations which are fully in effect; (2) this is largely the result of the consensus standards adopted en bloc early in OSHA's history rather than standards adopted on a substance by substance basis; (3) less than half of all known exposures to substances with presumed (as opposed to known) toxic effects are governed by regulations fully in effect; and, (4) although there is no significant duplication among regulations, there is fragmentation of effort among the administering agencies.

Communications Intelligence: Transcriber Output Enhancement.
Research rept. May 78-Jun 79,
Harold Martinek, Edgar M. Johnson, and Thomas E. Jeffrey. Sep 80, 67p Rept no. ARI-RR-1268

A workflow model of major transcriber functions was developed and time data for these functions were collected on 52 operational personnel. A time analysis was performed with respect to individual functions and logical sets of functions for a representative sample of the operationally meaningful groups of transcribers. The time analysis of transcriber functions indicated that about one-third of productive time was spent in the Listen, Rock, and Search functions and another one-third in doing these functions in conjunction with others. About 11% of the transcribers' time was spent in obtaining help from reference material, 5% in the tape changing functions, and 8% in team work functions. Differences clearly existed between organizational groups in the time spent on specific transcriber functions. Development of procedures to enable transcribers to exploit digitization and computer storage of taped communications should improve productivity at least 10% to 20% by eliminating search and tape changing functions, by reducing time spent in getting help from reference material and other transcribers and in giving help, and improving exploitation of source material. Experimental Investigation of Near Real-Time Interpretation Techniques for Transmitted Imagery.
Final rept.,
Thomas E. Ray, Robert B. King, and Marshall A. Narva. Aug 80, 52p ARI-RN-80-24
Contract DAHC19-71-C-0031

Eight interpretation concepts such as might be utilized at a ground terminal in conjunction with the handling of transmitted imagery were simulated. Four were one-man concepts while the other utilized two-man teams viewing the imagery in sequence. The one-man concepts were formulated around different combinations of the elements of availability of film speed control, and the decision criteria for the initial man of the team and the associated rescreening strategy of the second man of the team. Military image interpreters detected, identified, and reported targets on the imagery, presented on motorized light table under two film input rates, utilizing the conditions of the various experimental interpretation concepts. Interpretation performance was found to be influenced by the size of the viewing area and the use of a magnifying reticle to localize targets, in the one-man concepts. The incorporation of the speed control option did not significantly affect performance. Provision for control of film movement or differential emphasis on accuracy or completeness had no significant effects in the two-man concepts. (Author)

Excavation of Eleven Archaic and Woodland Sites in the Divide-Cut Section of the Tennessee-Tombigbee Waterways, Tishomingo County, Mississippi.
Final rept.,
Kenneth M. Binkley. Sep 78, 131p
Contract DACW61-76-C-0192

Eleven aboriginal sites were excavated to mitigate the data loss from the effects of construction in the Divide-Cut Section of the Tennessee-Tombigbee Waterway. Site descriptions, field methods employed and descriptions of material recovered are presented. Two contrasting sets of sites based upon two physiographic variables are discussed. Assemblage-level comparisons are made between sites lying north or south of Tennessee Valley Divide, and between sites located on bottoms of terraces. Results of these comparisons suggest that sites located north and south of the Divide are not significantly different and sites located on terraces are oriented more toward lithic tool production than are bottom sites. Temporal utilization, based upon projectile point typology, is shown for the ten sites which yielded projectile points. (Author)

Contract DACW01-79-C-0024
Prepared in cooperation with New World Research, Inc., Pollock, LA. See also Volume 2, AD-A107 152.

A reconnaissance level cultural resources survey and program of testing and evaluation in the proposed alternate corridor of the DDT Contamination Study, Wheeler Resorvoir, Redstone Arsenal, Alabama, resulted in the identification of 22 new sites and the testing of 26 previously recorded or newly discovered sites. The program of testing and evaluation was augmented by deep-testing to determine the area's geomorphic history and to assess the possible presence of buried sites. No buried sites were encountered; however, the testing program and subsequent analysis identified occupation in the study corridor from the Paleo-Indian through the Historic Period. A predictive model of site location, based on environmental variables, was formulated and resulted in the determination of high, medium, and low probability areas for site occurrence. (Author)

Archaeological Investigation in the Gainesville Lake Area of the Tennessee-Tombigbee Waterway. Volume IV. Biocultural Studies in the Gainesville Lake Area.
Investigations rept. no. 14,
Gloria May Caddell, Anne Woodrick, and Mary C. Hill. 1981, 312p
Contract DACW01-76-C-0120

This report describes the botanical remains analyzed from five sites, 1Gr1X1 1Gr2, 1Gr50, 1Pi61, and 1Pi33, located in Greene and Pickens Counties, Alabama, in the central Tombigbee River Valley. These five sites were excavated during 1976 and 1977 and, when taken together, represent most of the 12,000 year prehistory of the region. The 1976 and 1977 seasons at these sites marked the first time that a large sample of botanical remains from the area was systematically recovered, identified, and enumerated. In contrast, previous work utilized small samples from a few features, unsystematic recovery techniques, or failed to quantify the botanical remains. It nevertheless provided a starting point for this study, furnishing information on prehistoric plant use in the area. The previous research shows a reliance on wild plant resources from Archaic times through to the Mississippian stage, when cultivated plant remains form a large proportion of those identified. Archaeological Salvage Excavations at the Tibbee Creek Site (22Lo600) Lowndes County, Mississippi.
Final rept.,
John W. O'Hear, Clark Larsen, Marge M. Scarry, John C. Phillips, and Erica Simons. Jun 81, 265p
Contract DACW01-77-C-0015

This multicomponent site was located on Tibbee Creek in the floodplain of the Tombigbee River, at the western edge of the floodplain. Archaeological components ranging from the early portion of the Gulf Formational stage at approximately 1000 B.C. through the Mississippian stage dating about A.D. 1200 were present at the site. The indications are that the site locale functioned as a transitory camp during the Gulf Formational stage as well as through the later Miller I and II phases of the Middle Woodland period. The most intensive occupation of the site occurred during the late Woodland Miller III phase. Two house structures, several burials, and a large number of cooking/storage pits associated with the Miller III component were found during the excavations. The indications are that the site functioned as a base camp during Miller III. The final prehistoric component present at the Tibbee Creek site was a Mississippian farmstead which is assignable to the Lyon's Bluff phase and is closely aligned with the Moundville phase. Major features of this Mississippian component are a large wall trench house with 72 sq m of floor area, a group of 11 burials, nine of which were in a planned cemetery, and a number of ancillary pit features.

Radar Mapping, Archaeology, and Ancient Land Use in the Maya Lowlands.
R. E. W. Adams, W. E. Brown, Jr., and T. P. Culbert. 31 Mar 81, 27p NASA-CR-164931
Contract NAS7-100

Data from the use of synthetic aperture radar in aerial survey of the southern Maya lowlands suggest the presence of very large areas drained by ancient canals for the purpose of intensive cultivation. Preliminary ground checks in several very limited areas confirm the existence of canals and raised fields. Excavations and ground surveys by several scholars provide valuable comparative information. Taken together, the new data suggest that Late Classic period Maya civilization was firmly grounded in large-scale and intensive cultivation of swampy zones.

Project Lame 80F: A Cultural Resource Survey Around Boulder Beach, Echo Bay, Temple Bar and Cottonwood Cove in the Lake Mead National Recreation Area Clark County, Nevada and Mohave County, Arizona,
Richard H. Brooks, Robert R. Ellis, and Kathleen Bergin. Jun 81, 152p 1-2-11, NPS/WAC-81/18
NPS-CX-8100-0-0008

The prehistoric and historic archeological resources located by an intensive survey of four marinas at Lake Mead National Recreation Area, Boulder Beach, Echo Bay, Temple Bar, and Cottonwood Cove, are described in this report. A total of 6.25 square miles were surveyed, and 16 new archeological resources were added to 10 others that had been identified by previous investigations. The report concludes that many of the cultural activities prior to 1940 are related to a transient demographic pattern caused by exploiting geological resources. Aboriginally this is expressed by large lithic quarries and mining areas. Historically, it is expressed by subsequent mining and the development of Hoover Dam.

Historic Resource Study and Historic Structure Report Ninety Six: A Historical Narrative,
Jerome A. Greene. Nov 79, 297p FNP-560-82-02

The report discusses the significance of Ninety Six National Historic Site in South Carolina. One theme is the prominence of the village in the political, economic, and social development of colonial backcountry South Carolina during the 18th century. The other theme is based on the town's role in the American Revolution, first as a center of regional political dissension and later as a focal point of British hegemony in South Carolina resulting in the Siege of Ninety Six by General Nathanael Greene's command in May and June, 1781. The study recounts the beginnings of Ninety Six with the Indian occupation to its decline in the early 1800's. The majority of the text concentrates on the establishment of the military post at Ninety Six by the British and General Greene's siege on the fort. The report concludes with a brief synopsis of its establishment as a National Historic Site.

Effect of Task Duration on Voice Recognition System Performance.
Technical rept.,
J. w. Armstrong, and Gary K. Poock. Sep 81, 71p
Rept no. NPS55-81-017

This report describes an experiment examining voice recognition performance when subjects were required to make a decision every 1.5 seconds for 20 consecutive minutes while speaking to a voice recognizer at the same time. Results showed mental loading degraded voice recognition performance. Results also showed performance degradation similar to a vigilance decrement over eight trials of 2.5 minutes each. (Author)

Enhancing Technology Transfer of Computer Hardware and Software Architectures Using Human Factors in Initial Design.
Technical rept.,
Gary K. Poock, and Ronald J. Roland. Sep 81, 21p
Rept no. NPS55-81-019

This paper describes an experiment which attempted to subjectively measure the transfer of technology directly from the research arena to operational application. Areas of technology included recently developed computer software 'natural languages' based on artificial intelligence (AI) concepts, computer networking technology and automatic message handling systems. Exposure to this technology was accomplished over a 12 week period where the experimental group was provided with the tools and understanding to use the various research products. Data were collected from this experimental group prior to and after the 12 week period. Analysis of the data revealed interesting aspects concerning a user's perception of the value or utility of computer systems and computer software designed specifically to enhance the human-system interaction. Effect of Work Schedule, and Description of Career Intention on Organizational Effectiveness.
Technical rept.,
William H. Hendrix, and Nestor K. Ovalle. Aug 81, 16p Rept no. AU-AFIT-LS-5-81

Research was conducted to establish the effects of work schedule and description of career intention on three criteria of effectiveness (i.e., climate, satisfaction, and perceived productivity). Data were collected on 4786 military and civilian personnel located at five Air Force bases using the Organizational Assessment Package (OAP). Two separate one-way ANOVA's were used to test for differences between different work schedules and differences between individuals' descriptions of career intentions. Work schedules differed significantly with the category of 'daily work only' having higher values on the three criteria while 'swing shift' had the lowest values. Those planning to continue in the Air Force had the highest scores on all three criteria. (Author)

Effect of Number Supervised and Educational Level on Organizational Effectiveness.
Technical rept.,
William H. Hendrix, and Nestor K. Ovalle. Aug 81, 20p Rept no. AU-AFIT-LS-6-81

Research was conducted to establish the effects of number of people directly supervised and highest educational level obtained on three criteria of effectiveness (i.e., climate, satisfaction, and perceived productivity). Data were collected on 4786 military and civilian personnel located at five Air Force bases using the Organizational Assessment Package (OAP). Two separate one-way ANOVA's were used to test for differences between the number of people directly supervised by subjects and differences associated with the highest educational level obtained. Number of people supervised differed significantly with larger numbers supervised having higher values on all three criteria. Educational levels differed significantly on the criteria with high school graduates reporting lower values for climate and job satisfaction while doctoral degree subjects reported the lowest values for perceived productivity. Controller Staffing and Training at Four FAA Air Traffic Control Facilities.
9 Jul 81, 41p Rept no. GAO/CED-81-127

GAO's review of air traffic controller staffing, at the Chicago O'Hare and Denver Stapleton Airports and at the Chicago and Denver enroute traffic control centers indicated staffing level problems only at O'Hare. Some problems with controller training were noted at each facility. FAA is taking steps to alleviate the staffing problem at O'Hare and to correct some of the training problems. GAO also found no correlation between aircraft accidents or violations of FAA's separation standards for aircraft and controller staffing level or training. (Author)

Tightening Eligibility Standards Could Cut Involuntary Retirement Costs by Millions of Dollars.
25 Sep 81, 10p Rept no. GAO/FPCD-81-71

OPM needs to tighten the eligibility criteria for early retirements to avoid unwarranted separations and reduce costs. Hundreds of unwarranted involuntary retirements are occurring because current OPM policy permits employees to decline reasonable offers of other positions and retire early. The involuntary retirement program needs to be restructured to prohibit early retirements when an agency extends to the employee whose position is to be abolished a reasonable offer of another position. Restructuring the program would serve a twofold purpose by (1) retaining experienced employees who are retiring prematurely, and (2) reducing outlays from the civil service retirement fund. (Author)

Serious Problems Need to be Corrected before Federal Merit Pay Goes into Effect.
11 Sep 81, 26p Rept no. GAO/FPCD-81-73
Report to the Congress.

This report was prepared in response to a request from the Chair, Subcommittee on Compensation and Employee Benefits, House Committee on Post Office and Civil Service. It points out that problems with merit pay implementation could cause program failure unless immediate action is taken. These problems were identified earlier when GAO testified before the Subcommittee on July 21, 1981. As a result of the merit pay hearings, the Subcommittee requested that the President of the United States take action to prevent Federal agencies from implementing faulty pay-for-performance systems. The actions requested by the Subcommittee are similar to the recommendations contained in this report. (Author)

Recruiting Malpractice: Extent, Causes, and Potentials for Improvement.
20 Jul 81, 56p Rept no. GAO/FPCD-81-34
Report to the Honorable Sam Nunn, Member, Committee on Armed Services.

This report is based on a questionnaire survey of Armed Forces recruiting personnel in all services--Active, National Guard, and Reserve. Survey results show the perceptions of recruiters, noncommissioned officer supervisors, and commanding officers on the extent of malpractice within the respective service recruiting programs; possible causes for these actions; and probable corrective actions. GAO made this study in response to a request of Senator Sam Nunn, while Chairman of the Subcommittee on Manpower and Personnel, Senate Committee on Armed Services, who was concerned about the adequacy of service actions to control malpractice. Investigations in 1978 and 1979 determined that recruiting malpractice problems did occur in the Marine Corps and the Army. Overall, GAO surveyed personnel in seven separate recruiting programs. The highest perceived level of malpractice is within the Marine Corps program, followed in descending order by the Army, Army National Guard, Navy, Air Force, Air Force Reserve, and Air National Guard.

Veterans Administration Education Loan Program Should be Terminated: Legislative Action Taken.
28 Aug 81, 15p Rept no. GAO/HRD-81-128

Public Law. No. 95-476 provided additional authority to limit program participation to veterans attending high-cost schools. With the strengthening of the criteria used in defining allowable expenses for determination of financial need, loans awarded decreased from 28,908 in fiscal year 1978 to 7,761 in fiscal year 1980--a significant drop in program participation. Furthermore, the dollar value of loans disbursed dropped from $35.8 million to $6.7 million. A VA study notes that about 50 percent of the reduction appeared attributable to the new guidelines. Although overall program administration improved as a result of these changes, VA continued to experience severe problems with loan defaults. According to VA data, the cumulative loan default rate increased from 44 percent as of December 31, 1977, to 65 percent as of September 30, 1980. The default rate on matured loans for fiscal year 1980 was even higher--81 pecent.

Department of Labor Needs to Give CETA Prime Sponsors More Guidance and Assistance for Implementing Monitoring Requirements.
3 Sep 81, 8p Rept no. GAO/HRD-81-136

Section 121 of the CETA Amendments of 1978 required each prime sponsor to establish an independent unit for monitoring compliance with the act, the regulations issued thereunder, and the prime sponsor's comprehensive employment and training plan. The Secretary of Labor was required to annually assess the effectiveness of these units, particulary the adequacy of provisions made for funding, staffing, and insuring the independence and objectivity of monitoring practices and methods. Our overall objective was to assess Labor's and prime sponsors' implementation of the monitoring requirements. In this regard, we concentrated on IMU staffing, training, and monitoring activities since the 1978 amendments were enacted. To accomplish our objective, we examined the status and operations of IMUs in fiscal year 1980 at the New Bedford Consortium, New Bedford, Massachusetts; Balance of State of Maine, Augusta, Maine; and Balance of State of New Hampshire, Concord, New Hampshire. Our work focused on the IMUs' staffing and organization, monitoring procedures, and results achieved. In assessing the results, we compared the prime sponsors' progress in implementing the IMU concept with Labor criteria. We interviewed officials and reviewed records and documentation at Labor's national office, the Region I office, and the prime sponsors. In addition, we assessed the region's oversight role relating to IMUs at the three prime sponsors. (Author)

Delays in Receiving and Investing Taxes are Reducing Railroad Retirement Program Interest Income.
24 Sep 81, 25p Rept no. GAO/HRD-81-112

In recent years the financial stability of the Account has been seriously impaired. The Board predicts that it may not be able to pay total benefits by 1982. Because of this, we sought to determine how more timely tax deposits could improve the programs's cash flow. Since this study began, the Congress has passed the Omnibus Budget Reconciliation Act of 1981 which contains provisions dealing with railroad retirement's financial problems. We have examined these provisions and found that they did not included the matters discussed in this report. Even if the legislative provisions improve the financial outlook for the Account, we believe that it is in the best interest of the program to maximize interest earnings to the Account. Our work was conducted primarily at the Board's headquarters in Chicago, Illinois. We reviewed the legislative history of certain sections of the Railroad Retirement Act, as amended; interviewed officials of the Board, the Treasury, and the Internal Revenue Service (IRS); interviewed representatives of several railroads selected at random; and reviewed and analyzed pertinent agency records. The Board, Treasury, and the Association of American Railroads (AAR) reviewed and commented in writing on a draft of this report. We incorporated their comments where appropriate and the text of each agency's comments is in appendixes I through III. In estimating the additional interest income which could have been earned with more frequent deposit requirements, we used the taxable payroll totals railroads reported to the Board and applied the appropriate tax rates to determine payroll taxes paid for fiscal years 1978-80.

An Appraisal of Performance Appraisal Summary Results of a Large Scale Study.
Interim rept.,

Susan Resnick, and Monty Mohrman. May 81, 53p
81-5(11), 1, AD-E001 182
Contract N00014-81-K-0048

The results of an organizational study of performance appraisal are reported. The study documented performance appraisal objectives, beliefs and assumptions described and evaluated the company's performance appraisal system; and made recommendations regarding performance appraisal practice. On site interviews, questionnaires, and personnel records served as data sources. Over 2000 superior/subordinate pairs responded to questionnaires. Analysis of the data revealed importances between supervisors and subordinates about objectives of personnel performance appraisal. In addition, the two groups had different beliefs and assumptions about performance appraisal.

Minnesota Univ., Minneapolis. Computerized Adaptive Testing Lab.
A Validity Comparison of Adaptive and Conventional Strategies for Mastery Testing.
Research rept.,
G. Gage Kingsbury, and David J. Weiss. Sep 81, 35p
RR-81-3, AD-E001 183
Contract N00014-79-C-0172

Conventional mastery tests designed to make optimal mastery classifications were compared with fixed-length and variable-length adaptive mastery tests in terms of validity of decisions with respect to an external criterion measure. Comparisons between the testing procedures were made across five content areas in an introductory biology course from tests administered to over 400 volunteer students. The criterion measure used was the student's final standing in the course based on course examinations and laboratory grades. Results indicated that the adaptive test resulted in mastery classifications that were more consistent with final class standing than those obtained from the conventional rest.

Limits on Receipt of Multiple Disability Benefits Could Save Millions.
28 Jul 81, 18p Rept no. GAO/HRD-81-127
Report to the Chairman, Committee on Finance, United States Senate.

In performing our review, we determined that about 4,900 Federal, State, and local programs include disability benefits. Forty-five of these programs are administered by the Federal Government. We defined Federal disability programs as those exempt from the Employee Retirement Income Security Act or those supported by tax revenue. During fiscal year 1980, these Federal programs paid over $37 billion in benefits to over 11 million beneficiaries. The most recent data on the State or local programs gathered by the Bureau of the Census in 1977 showed that for 3,075 State and local government benefit programs about 152,000 persons were receiving annual disability benefits of about $600 million. Data were not available on the other State and local programs. A sample of 11,669 DI recipients on the rolls as of March 1980 was matched against the disability rolls of the 8 largest Federal retirement systems, 12 large State and local government retirement systems, and the workers' compensation programs of the States and territories. The programs matched represented about 98 percent of the total Federal beneficiaries and about 38 percent of the total State and local government beneficiaries. The results showed that 1,913 (about 16 percent) of the DI beneficiaries also received benefits from one or more of the matched programs. About 41 percent of these beneficiaries received aggregate benefits exceeding their predisability earnings. (Author)

President's Task Force on Aircraft Crew Complement, Washington, DC.
Report of the President's Task Force on Aircraft Crew Complement,
John L. McLucas, Fred J. Drinkwater, III, and Howard W. Leaf. 2 Jul 81, 107p

The President's Task Force on Aircraft Crew Complement: (1) Reviewed the August 1980 decision by the Federal Aviation Administration to certify the McDonnell Douglas DC-9-80 aircraft for operation by a minimum of two persons; and (2) made recommendations concerning the use of two-member crews in the proposed Boeing 757 and 767 and other 'new generation' commercial jet aircraft. Principal conclusions of the Task Force are: Operation of the DC-9-80 by a crew of two is safe and the FAA's certification of the DC-9-80 for operation by a minimum crew of two was proper and in compliance with the Federal Aviation Act. Preparation and Design for a Training Effectiveness Evaluation of Device 2F64C for Replacement Pilot Training,
Robert F. Browning, William C. McDaniel, and Paul G. Scott. Aug 81, 98p Rept no. TAEG-108

This report presents the initial effort in a program to assess the training potential of a new simulator (Device 2F64C) for training SH-3 replacement helicopter pilots. The report provides an account of the work accomplished and the preparations for assessing the device when ready-for-training. The report contains: A description of the training situation at the fleet readiness squadron prior to and during the transition to a new curriculum which resulted from an instructional system development (ISD) program: A discussion of TAEG's initiatives to enhance the training of replacement helicopter pilots: A discussion of the factors impacting on syllabi content and the process used in developing syllabi for assessing the training effectiveness of Device 2F64C: A description of the detailed scenarios developed to ensure effective implementation of a syllabus designed to realize the maximum potential of the new device: The outline of an experimental plan for assessing the training effectiveness of Device 2F64C. Mathematics Curricula Requirements and Performance Levels in Navy Class 'C' Electronics Schools.
Technical rept. 1 Dec 79-1 Jun 80,
Meryl S. Baker. Oct 81, 37p Rept no. NPRDC-TR-82-4
See also Rept. nos. NPRDC-TR-81-4, NPRDC-TR-81-2 and NPRDC-TR-81-3.

Instructors of 41 Navy electronics 'C' courses were presented with a list of 70 mathematics skills and asked to indicate (1) how important they were to successful course performance and (2) whether required skills were prerequisite to, reviewed in, or taught in the course. Based on results obtained, a mathematical skills test was developed for the 'C' course for the Aviation Electrician's Mate and Avionic Technician (AE/AV) ratings, and administered to entering and graduating students. Significant differences were found between the two groups on total test and in seven topic areas, most of which were taught during the course. Since student performance in both groups was only marginal in most topic areas considered critical for successful course performance, it is possible that either the importance of these skills is overrated or criteria for successful course completion are too low. Ordinal Syllabus for Air Intercept Controller Prototype Training System.
Final rept. 28 Sep 78-28 Jun 81,
Michael W. Grady, Robin Halley, and Larry H. Nowell. Sep 81, 150p 8641-A006, NAVTRAEQUIPC-78-C-0182-3
Contract N61339-78-C-0182
See also Rept. no. NAVTRAEQUIPC-78-C-0182 and NAVTRAEQUIPC-78-C-0182-1.

The Ordinal Syllabus for the Air Intercept Controller Prototype Training System presents training tasks to be addressed in the ordered sequence of the instructional flow for the automated adaptive training system. Whereas the preceding Behavioral Objectives and Objectives Hierarchy were job task oriented, in order to identify requisite skills for the Air Intercept Controller, the Ordinal Syllabus now addresses the sequence of instruction to be accomplished in the classroom and laboratory to develop the skills which will prepare the AIC trainee for control of live aircraft. Structuring the instructional flow places lessons within units of progressive levels of skills development. The sequencing integrates skills development with introduction to the training system and application of skills on the Training Enhancement Console. This report presents the prototype training system courseware. The instructional sequence for the courseware is identified in detail at the lesson level. Associated behavioral objectives, end of course standards, new vocabulary and new Naval Tactical Data System (NTDS) functions also are listed. Additionally, the syllabus development process is documented.

AD-A107 001/0 PC **A04**/MF **A01**

Behavioral Objectives for Air Intercept Controller Prototype Training System.
Final rept. 28 Sep 78-28 Jun 81,
Robert Halley, J. Thel Hooks, Jr., Harry G. Lankford, and Larry H. Nowell. Sep 81, 68p 8641-A004, NAVTRAEQUIPC-78-C-0182-1
Contract N61339-78-C-0182

The Behavioral Objectives Report has multiple functions and purposes, both to the contractor and to the Government. For the contractor, this report provides the impetus to perform an extremely close review of the Air Intercept Controller (AIC) Job Task Analysis previously performed by Logicon. From this careful survey came the behavioral objectives which make up the core of this report. Often, as in this case, the step-by-step review of the job also (1) helps to define areas of the job previously undefined or loosely defined and (2) helps to uncover job tasks previously unaddressed. For the Government, the report serves at least two functions. First, the report allows the contracting agency a means for detecting the direction and scope of the work being done by the contractor. In this way, any existing misunderstandings can be cleared up at

an early date. Second, the report serves as a baseline document for establishing mutually defined concepts of the training development task ahead.

Dunlap and Associates, Inc., La Jolla, CA. Western Div.
Conceptual Development of a Preliminary LSO Carrier Landing Training Aid.
Final rept. Mar 78-Apr 80,
Clyde A. Brictson, and Steven T. Breidenbach. Sep 81, 44p NAVTRAEQUIPC-77-C-0166-2
Contract N61339-77-C-0166

A conceptual plan designed to aid the Landing Signal Officer (LSO) in training pilot carrier landing skills is described. The plan, named the Automated Performance Assessment and Remedial Training System (APARTS) employs basic principles of learning in integrating the Night Carrier Landing Trainer (NCLT) with Field Carrier Landing Practice (FCLP). Application of the APARTS conceptual plan resulted in the development of two computer programs, PADDLES and GRADER, which are described and documented. The two computer programs process, store and summarize LSO grades and comments of a pilot's landing performance during FCLP. Individualized training is accomplished through diagnostic training feedback provided by program printouts. NCLT remedial instruction is specified to correct a pilot's landing technique problems identified during FCLP. Future development and integration of APARTS for improved carrier landing training effectiveness is outlined. (Author)

Technical Communication--Taking the User into Account.
Research rept. 1 Jun-31 Aug 81,
Thomas L. Crandell, and Marvin D. Glock. Aug 81, 59p Rept nos. RR-5-SER-B, TR-4
Contract N00014-80-C-0372
Prepared in cooperation with Broome Community Coll.

This research study investigated whether reading effectiveness of procedural texts for a performance task is influenced by media formats which differed in design according to the Educational Cognitive Style (ECS) preference of the user/reader. Significant individual differences among the cognitive style types in their abiiity to follow the directions was found. One cognitive style type in particular tended to be more compatible with processing and understanding the technical information. Statistically significant differences were also found to result from the effect of media format design--graphics had a strong facilitative effect on user efficiency and accuracy. These results indicated that to plan and design effective instructional materials which maximize the user's understanding of the task, designers should recognize and focus on the user's strengths and weaknesses for processing technical information. A model for designing technical instructions based on the user's needs was presented. (Author)

Air War College Class of 1981 Retention Survey.
Research rept.,
Robert E. Lee, Jr. Apr 81, 218p Rept no. MS108-81

This study reports the results of a retention survey administered by the author to the active-duty Air Force members of the Air War College Class of 1981. The purposes of the survey were to assess the career and retention attitudes of the Class of 1981, determine the factors shaping those attitudes, and compare the results obtained with those from a similar survey administered to the Air War College Class of 1980. The 1981 survey focused on various factors which affect retention, including financial matters, family considerations, leadership, and social life/camaraderie. It also sought to determine the career intentions of the Class of 1981. The results of the 1981 survey were in many respects better from an organizational viewpoint than were the results of the 1980 survey. The analysis of the results also revealed that the retention outlook among high-quality senior officers is positive and healthy. (Author)

Air Force Occupational Measurement Center, Randolph AFB, TX.
Avionic Communications and Avionic Navigation Systems Specialties AFS 328X0 and 328X1.
Occupational survey rept.
Sep 81, 145p

This report evaluates the feasibility of consolidating Avionic Communications (AFS 328X0) and Avionic Navigation Systems (AFS 328X1) specialties to decrease specialization and job dissatisfaction, and to increase personnel utilization. The job structure resulting from the combined sample of AFS 328X0 and AFS 328X1 was very heterogeneous. Sixty-nine job types making up 12 clusters and four independent job types were found. These grouped into four functional areas; primarily 328X0 technical jobs; technical jobs which overlapped the 328X0 and 328X1 specialties; primarily 328X1 technical jobs; and management and support jobs. The area of overlap was relatively small in proportion to the specialty specific functional areas. The findings of this study indicate that, while merger of these two specialties is possible, the majority of jobs are being served satisfactorily by the present classification structure. Both career ladder analysis and duty AFSC analysis show that the degree of differentiation is far greater than the degree of commonality. Review of the training programs indicate that such an AFSC consolidation would impact negatively on more jobs that it would help.

Initial Skill Training for Navy Enlisted Personnel.
29 Jun 81, 4p Rept no. GAO/FPCD-81-56

Our survey addressed how the Navy determines which job tasks a sailor should know, how it insures the tasks are taught, and whether fleet supervisors are satisfied with recent graduates of initial skill training. (Author) We note that the Navy is taking action to improve skill training by developing new training curricula specifically linked to the job tasks relevant to the Navy ratings. Because these new curricula are not yet fully developed, however, we could not assess the effectiveness of the Navy's efforts to improve initial skill training. Although at this time we do not plan further analyses of the Navy's efforts to link job tasks to training curricula, we express here some concerns that we believe should receive attention as the Navy moves forward in improving initial skill training.

Alternatives to the Current Method of Computing General Schedule Pay.
26 Aug 81, 4p Rept no. GAO/FPCD-81-60

General Schedule employees' annual salaries are based on 2,080 hours, or 260 workdays, even though there are usually one or two additional workdays in a calendar year for which employees are also paid. Our review showed that computing biweekly pay using either actual or average work hours in a year would reduce Government costs by approximately $120 million annually. We reviewed the legislative basis for establishing the existing method for computing pay, examined alternatives to the current method, and examined the impact these alternatives would have on payroll systems. We identified two feasible alternatives to compensate employees on the basis of either actual or average work hours in a calendar year.

Follow-Up on Actions to Improve Coordination and Utilization of Human Resources Research and Development.
23 Jul 81, 7p Rept no. GAO/FPCD-81-62

To identify the actions taken to coordinate and encourage the use of human resources research and development, we interviewed key personnel within the Office of the Assistant Secretary of Defense (OASD) (Manpower, Reserve Affairs and Logistics (MRA&L) and the Office of the Under Secretary of Defense for Research and Engineering (Research and Advanced Technology) and at the major laboratories in each service which conduct human resources research. We also reviewed the laboratories' research plans and programs, their activities aimed at increasing utilization of human resources research and development, and tri-service efforts to improve research coordination and the use of results. In addition, we reviewed a wide variety of literature published since 1965 on knowledge transfer and research utilization. The scope of our review was limited in that we did not assess how much the actions taken have increased utilization, nor did we try to review the entire human resources research and development program or to judge its scientific merit and professionalism. Our review of laboratories focused on ARI, NPRDC, and AFHRL because they are the principal DoD human resources laboratories, accounting for 58 percent of military science and technology in this area during 1980.

Problems with the Small Business Administration's Merit Appraisal and Compensation System.
21 Sep 81, 8p Rept no. GAO/FPCD-81-74

Some of these problems appear to be associated principally with implementation; others appear to be recurring such as: (1) difficulties in developing, with employee involvement, meaningful performance standards; (2) problems with rating distribution skewness, resulting in management's prescribing a distribution of ratings contrary to the Office of Personnel Management (OPM) regulation; and (3) problems with using preestablished performance objectives as the basis for performance appraisals leading to the substitution of new appraisal criteria after the appraisal period contrary to the requirements of the Civil Service Reform Act. There are significant potential problems with SBA's merit pay system in 1981. However, we believe that suspending merit pay until these problems are resolved would not be feasible because of the difficulties in changing the compensation approach back to the General Schedule system.

Fewer Agent Transfers Should Benefit the FBI and Its Agents as Well as Save Money.
24 Sep 81, 10p Rept no. GAO/GGD-81-102

In response to concerns expressed by members of the Congress, agency officials, and individual agents, we recently conducted a survey of agent transfer policies and programs in the Secret Service; the Bureau of Alcohol, Tobacco and Firearms; and Federal Bureau of Investigation (FBI). Our objectives were to determine whether rotation programs (1) are similar among Federal law enforcement agencies, (2) negatively affect investigations, (3) result in unnecessary costs to the Government, and (4) adversely affect agents' financial situations and career goals. Because recent changes in your Career Development Program have alleviated the problems we identified during our survey, we have discontinued our work on FBI agent transfers. We believe that the Career Development Program modifications should benefit both the FBI and the individual agents. The full extent of these benefits, however, will not be known until the new policy has been in effect for a while.

Allegations that a Political Appointee at the Environmental Protection Agency was Exercising Control over the Office of the Inspector General.
25 Jun 81, 4p Rept no. GAO/AFMD-81-77

This letter is in response to a request regarding a political appointee allegedly exercising control over the Environmental Protection Agency's (EPA's) Inspector General's Office. In this regard, a copy of was supplied an article from the February 6, 1981, Chicago Tribune indicating that a Mr. James F. Browne was the political appointee in question, and that he had ordered briefings on some of the most sensitive cases in the Inspector General's files. The Subcommittee wanted information on: the background and qualifications of Mr. Browne, including verification of statements in the Chicago Tribune that Mr. Browne's political background involved working as an advance man for the Reagan/Bush campaign; the background of Mr. Ernest Minor, who as Special Assistant to the Acting Administrator hired Mr. Browne; the impressions left with Office of Inspector General personnel as to Mr. Browne's role in their office; the type of documents Mr. Browne had access to and whether these documents are commonly disclosed during the Inspector General's work; and the date after which Mr. Browne was no longer working with personnel in the Inspector General's Office.

Issues Related to the Longshoremen's and Harbor Workers' Compensation Act.
Interim rept.
12 Jun 81, 11p Rept no. GAO/HRD-81-107

To determine the effects of the 1972 amendments to LHWCA, we interviewed (1) Labor officials in Washington, D.C., and in the district offices who have responsibility for administering this compensation program; (2) officials representing insurance carriers, maritime employers, and maritime employees; and (3) attorneys representing employees and employers in LHWCA compensation cases. We also reviewed recent testimony before the House Committee on Education and Labor and the Senate Committee on Labor and Human Resources on the administration of this act. To evaluate Labor's procedures for claims administration and adjudication, we reviewed 100 randomly selected cases in each the San Francisco and New York district offices. We also used a questionnaire to obtain program information from the other district offices responsible for handling LHWCA claims. We validated selected responses to our questionnaire by performing limited verification work at the Long Beach, Houston, New Orleans, and Boston district offices. Other information on program administration was obtained from OWCP reports on district office LHWCA activities.

The Veterans Administration's Efforts to Consolidate Computer Programming Resources at a Single Location.
18 Sep 81, 17p Rept no. GAO/HRD-81-148

The purpose of our review was to assess the adequacy of the tangible or measurable aspects of VA's justification for establishing the CDC in Austin. We examined the estimate of costs and benefits of establishing the CDC derived from comparing the costs of performing computer program development and maintenance work over a 5-year period under (1) the present decentralized or five-DPC approach, and (2) the proposed centralized or CDC approach. (Within the cost/benefit frame of reference, the costs of the present approach are called benefits if they exceed the costs of the proposed approach. Further, savings or net benefits are the costs of the present approach in excess of the proposed approach.) We also examined the methodology and productivity data ODM&T used to project personnel savings to accrue from establishing the CDC. We used CDC cost and benefit data available as of the end of April 1981.

The Determinants of Career Decisions of Air Force Pilots.
Doctoral thesis,
Russell Theodore Roth. May 81, 201p Rept no. AFIT-CI-81-9D

The present study analyses the individual career decisions of Air Force pilots. The inability of the Air Force to retain adequate numbers of qualified pilots in recent years motivated this study. This thesis presents a model of career choice based upon individual utility maximization. The individual is assumed to maximize his utility between continuing as an Air Force pilot and moving to the private sector. Private sector employment may be in either the airline industry or some other segment of the economy. A utility-maximizing choice is made in each discrete time period. The data used in the estimation of this model comes from officer personnel records for pilots who began service between 1968 and 1972. Their individual characteristics were combined with the appropriate economic factors in each year to model their choices. An error components specification with an equicorrelated correlation matrix was used to estimate a multivariate probit model. Likelihood ratio tests with an independent multivariate probit model conclusively rejected the independent probit model. The results of the estimations are consistent with the theoretical model presented. The rate of airline hires has a negative effect on retention. The real wage level of Air Force pilots and their pay in relation to civilian pilots has a positive effect on the rate of retention and the individual probability of remaining in the Air Force. The rate of unemployment also has a positive effect on the probability of remaining in the Air Force. (Author)

Development of a Computer Based Air Combat Maneuvering Range Debrief System. Volume I.
Interim rept. Aug 78-Jan 80,
Anthony P. Ciavarelli, Kenneth W. Pettigrew, and Clyde A. Brictson. Sep 81, 83p NAVTRAEQUIPC-78-C-0136-1
Contract N61339-78-C-0136

Volume I of this Interim Report presents an overview of the technical approach to ACMR debrief development, and a preliminary debrief design based on key training objectives and their associated aircrew task measures. The requirements for a computer based debrief system are discussed, together with the rationale for selection of an HP 45-T system. Preliminary data formats for key training objectives are presented. Finally, ACMR debrief software packages which are currently under development are identified and described. The proposed debrief system is responsive to an operational requirement for both overall performance assessment and diagnostic appraisal. For this reason, we have chosen to call our debrief system the Performance Assessment and Appraisal System (PAAS). Future plans are outlined, and center chiefly on the development of a demonstration system for ACMR debrief. Further development of criterion measures across remaining training objectives will be necessary to complete a final debrief design such that it represents a full treatment of all aspect ACM performance evaluation. On the Design of Simulations of Command and Control Processes.
Final rept. 1 Aug 79-31 Oct 80,
Roland V. Tiede, Roger A. Burt, and Theodore T. Bean. 26 Nov 80, 141p SAI-81-285, ARI-RN-80-39
Contract MDA903-78-C-2030
See also Rept. no. ARI-RN-80-40, AD-A107 424 and ARI-TR-421.

This report covers two additional design requirements to an existing design for a battle simulation intended for research, development, or training. The first requirement is to simulate the command and control processes so that they reflect human performance in the information processing and decision making sequences. The second is to provide alternative configurations for the 'player' staff modules so that the investigator may select the configuration best suited to his behavioral research objectives. Both problems are approached by combining the known human factors in command and control with a detailed structuring of the action processes employed by the command group/staff. All relevant aspects of human performance except the higher-level decision making operations can be realistically simulated. A trade-off is found to exist in the alternative configurations between the realism of staff play, the ability to make behavioral measurements, and the cost of personnel and computer hardware/software. See also Rept. no. ARI-RN-80-39, AD-A107 423 and ARI-TR-421.

This report develops principles of task design for interactive simulations in which staff players execute the command and control of a simulated battle. A companion report on the design of simulations of command and control processes presents the basic design framework of a battle simulation capable of application alternatively to research, development, or training. This framework includes consideration of alternative configurations of the player staff modules so that an investigator may select a configuration best suited to his behavioral research objectives. The guidelines for effective task design are developed from the alternative configuration. (Author)

Flexitime in an Army Medical Center.
Final rept.,
A. David Mangelsdorff. Apr 81, 35p Rept no. HCSD-81-002

The compressed and flexible workweeks have been receiving increased attention in the federal government. The use of variable work schedules, known as flexitime, allows employees some latitude in establishing their starting and stopping times on the job. The flexible working hours scheme is not applicable to the enhancement of the work environment in all departments of all organizations. The objectives of the present study were: to determine the effects of flexitime on staff perceptions and to determine whether there are differences between activities on flexitime versus activities not on flexitime. The overall results of the study suggest that flexitime is perceived as more demanding on supervisors and those with specific types of responsibilities (like direct patient care).

A Descriptive Analysis of First Term Attrition from U.S. Naval Ships.
Master's thesis,
Carl Glynn Carlson. Sep 81, 202p

This thesis was conducted to analyze certain factors effecting first-term attrition from U.S. Naval ships. The Survival Tracking File (STF) was used as the primary data source, and from it files were constructed that permitted three areas of study. First, the overall cohort of a year's worth of first term enlistees was examined. The survival curve for the cohort was generated and individual monthly cohorts were examined for attrition patterns. Secondly, overall attrition percentages were calculated for individual ships and for classes of ships and these attrition percentages were then examined for differences using statistical techniques. An ANOVA model using transformed data proved accurate in explaining attrition variance. Lastly, a comparison between attrition per month and underway hours per month was made for classes of ships and for individual ships of three specific classes. A rough relationship was observed, for certain classess of ships, between peaks of high underway hours and peaks of attrition. In looking at individual aircraft carriers, the attrition percentage seemed to be inversely proportional to underway hours per month. Several of these findings warrant further investigation so that the Navy may more fully understand it attrition problem and thereby take steps to alleviate it. (Author)

See also Volume 3, AD-A107 698.

This research report demonstrates that a complex Computer-Assisted Instruction (CAI) system can be integrated within a tactical computer system and that learning does take place within the tactical computer environment. While it is unreasonable to expect that a given method of instruction will be applicable to all Army personnel, it should at least cover a fairly broad range of personnel with varying aptitude (G) scores. These personnel present problems in regard to training costs. While student costs (time) is a consideration, instructor time (cost of preparation and instructing) is a more heavily weighted factor. A training program which has the capability to reduce instructor time in relation to student time offers a cost-effective, cost-saving approach to training.

Lesotho Agricultural Sector Analysis Project, Maseru.
Profiles of Basotho Farmers. Part I: Images of Basotho Farmers. Part II: Are the Basotho Subsistence Farmers. Part III: Progressive Farmers in Lesotho.
Discussion paper,
Gene C. Wilken, and Martin H. Fowler. Jun 79, 59p LASA/DP-8, AID-PN-AAH-351
Prepared in cooperation with Colorado State Univ., Fort Collins. Dept. of Economics.

Understanding the complex characteristics of Basotho farmers - who are resilient but who also resist introduction of new crops, tools, or techniques - is necessary if development planning for Lesotho's agricultural sector is to be effective. This report characterizes Basotho farmers through three essays entitled Images of Basotho Farmers, Are the Basotho Subsistence Farmers, and Progressive Farmers in Lesotho. All three studies elucidate the relationship between previous assump-

tions and present policy. It is uncertain that these programs can effectively disseminate new methods or produce widespread benefits in the agricultural sector. Indeed, they may create social disparity and thus impede agricultural development. Reliance on the inherent hardiness of the Basotho farmer and his highly developed local institutions represents a sounder basis for future sector development.

Synthesis of Recent Research on Medical Career Decisions: A Comparative Study of Physicians from Two Decades. Executive Summary and Final Report.
Rept. for 1 May 80-28 Feb 81,
Sandra Reitz Wilson, Frances B. Stancavage, and Lauress L. Wise. Mar 81, 316p NCHSR-81-232
Grant PHS-HS-04153

The research project compared the career development patterns of two recent cohorts of physicians, participants in AIR's Project TALENT Longitudinal Study of the High School classes of 1960-63 and participants in the AAMC's Longitudinal Study of Medical School Graduates of 1960. These cohorts obtained their medical degrees approximately a decade apart. For each cohort, profiles of the personal characteristics and educational experiences of physicians in nine specialty groups and six sizes of practice community were drawn. Multivariate discriminant analyses were also conducted to determine the predictability and practice location choice. Results indicated that these career choices are predictable at a level considerably above chance for both cohorts. Some changes attributable to historical trends in medical selection and training were observed, but in general, the nature of the predictive relationships and the level of predictability were stable across cohorts. Results of the analyses were incorporated into a model of medical career decision-making.

Boston Univ., MA.
The Impact of Regulation upon Job Design: A Preliminary Study.
Final rept. Nov 80-Oct 81,
Paul Osterman. Oct 81, 60p ASPER/PUR-81/0419/A
Contract DL-B-9-M-1-0419

The purpose of this study was to conduct a preliminary inquiry into the question of whether government regulatory activity has led firms to alter the design of jobs. First, a series of interviews and case studies were conducted with several firms to develop an understanding of how the job design process works. The interviews led to a theory of job design which emphasizes that firms should not be viewed as internally homogeneous units. Rather different clusters of jobs have different security, advancement, and wage characteristics. Firms have some choice into which clusters tasks are placed and the determinants of these choices were examined. In the second part of the report a specific regulatory program, the Office of Contract Compliance, is examined. It was hypothesized that if this program is successful in improving opportunities for women by encouraging firms to create new jobs ladders then turnover rates (and quit rates) will decline. In a statistical study using national data it was found that in fact quitting varies inversely with the attention paid to an industry by the OFCCP. Thus this regulatory program does seem to influence job design and opportunity.

Work Simplification Training Techniques and Materials.
25 Apr 66, 65p VA/TB-10-15
Supersedes Oct 59, TG10-9.

The training program in work simplification was prepared to help plan training sessions. The program can be used as a course in itself or as a supplement. The program is divided into: Suggested Course Outline, Training Aids, and Bibliography. The 36 color slides developed by the Veterans Administration (VA) are keyed to the suggested course outline. The sessions include attitude (philosophy), the planned approach to installing improvements, tools and techniques: motion economy, flow process charting, work count, layout and work distribution charting. Tools and techniques are further described, and effective use of several visual and audio aids is outlined. An annotated list of motion picture films on work simplification in hospitals and a bibliography are provided.

Employment and Unemployment Among Vietnam Era Veterans: An Analysis of the 1979 National Survey of Veterans,
James J. Byrne. Aug 81, 32p RESEARCH MONO-14-A, VA/81-5045

This report analyzes the data of the 1979 National Survey of Veterans and compares unemployment statistics for Vietnam-theater veterans with other veterans of the Vietnam era (VNE). Aggregate data show similar statistics for both Vietnam veterans and other veterans of comparable age, and the two groups are similarly distributed in demographic background characteristics and in labor market behavior. The differences which did appear, such as a higher percentage of unemployed college-educated Vietnam veterans, a lower percentage earning high salaries, and an urban-rural unemployment differential were not dramatic. The report recommends more detailed study of specific subgroups of Vietnam theater veterans, such as those with prolonged heavy combat experience and minority groups. A bibliography and a questionnaire are included.

Organizational Socialization: Predictors of Commitment during and After Entry.
Doctoral thesis,
Roy W. Hinton. Aug 81, 209p DLETA-91-17-79-03-1
Grant DL-91-17-79-03
Prepared in cooperation with Department of the Navy, Washington, DC.

The predictors of commitment to membership in the Naval Reserve examined by this study include the individual's perceptions of various aspects of the organization, the process by which he/she made the decision to join, and support of family, friends and full-time employer. The research design, drawn from the organizational socialization literature, is a longitudinal study utilizing questionnaire data collected at entry into the organization and six months after entry. Seventy-five Naval Reservists are the focus of the research. Results indicate that support of family, friends and full-time employer, importance of extrinsic rewards, and perceptions of freely choosing to join are most strongly related to commitment. The sample was divided into two groups according to the extent to which the individual responds to demands of the situation or the extent to which he/she determines behaviors on the basis of internal dispositions. Results for the two groups suggest that degree of responsiveness to the situation or internal cues is an important moderating variable in determining predictors of commitment. Implications for researchers and practitioners are discussed.

An Assessment of Factors Affecting Employment of Temporary Foreign Labor in the East Coast Apple Harvest,
James S. Holt. Mar 81, 90p DLETA-20-51-79-39-1
Contract DL-20-51-79-39

The purpose of this study was to identify why some apple growers, in areas using temporary foreign (H-2) workers were able to harvest their apples without such workers. Persons knowledgeable about the industry and growers were interviewed in each major apple producing area. The study found that most temporary foreign workers are employed in areas of low population density, and high seasonal labor demand, where apples are the predominent crop using seasonal labor, and in which the use of illegal aliens is still relatively limited.

An Approach to Selecting Panels of Experts,
Howard Bregman, Ruth Katz, and John Salasin. Mar 77, 65p MTR-7482
Grant PHS-MH-26058

Selecting the right experts to participate in studies utilizing expert opinion is a complex task. The literature on selection of experts is sparse, but several problems have been identified: (1) stacked panels of experts, (2) experts who are experts in name only, and (3) interpretation of survey results when the experts surveyed are anonymous and participant selection criteria are secret or unknown. These problems were addressed in a survey of experts in the children's mental health services area. A method for selecting experts is presented and the results of its use are evaluated. The method is shown to be successful.

The Delphi Technique: Analysis of Responses to a Survey of Children's Mental Health Services Development,
Howard Bregman, and John Salasin. Sep 77, 42p MTR-7631
Grant PHS-MH-26058

Analysis procedures were developed to analyze how well a modified Delphi survey process worked in developing consensus among a diverse group of experts. Procedures included: (1) measuring consensus among the experts' responses, (2) establishing statistical significance of responses, (3) determining which professional characteristics affected participants' responses, (4) determining how many experts and how many Delphi iterations would be needed for future surveys to identify R&D objectives, and (5) checking the reliability of the results. These procedures were applied to a modification of the Delphi technique which was used to survey experts in the area of children's mental health services to identify objectives for research and development in the children's area. The survey demonstrated that opinions and judgments generally con-

sidered to be too soft to be rigorous can be made amenable to measurement using the Delphi approach. Further, the measurements taken can be statistically analyzed yielding insight and understanding of the experts' position.

An Approach to Identifying Objectives for Targeted Research Programs,
J. Salasin, and D. J. Entingh. Mar 77, 61p MTR-7490
Grant PHS-MH-26058

The paper describes a five-step generalized approach to defining technical R&D objectives for applied research programs. The approach emphasizes: (1) specifying the technical scope of the program, (2) describing desired end-results of the program ('targets'), (3) specifying the roles that objectives will play in the program and information needed to allow the objectives to serve those roles, (4) specifying a structure for representing objectives, and (5) planning processes for collecting needed information. Well-defined technical objectives can contribute to improved research planning, project and program monitoring, and dissemination and utilization of research results.

American Indian Jobs/Skills Bank.
Final rept.
Mar 81, 138p HUD-0002053
Contract DOL-9-99-2215-0822
Sponsored in part by Administration for Native Americans, Washington, DC. Bureau for Indian Affairs, Washington, DC.

This document represents the final report for the American Indian Jobs / Skills Bank project, which designed and field tested a national, computerized job referral system for American Indians. The project ran for over 15 months, beginning on June 7, 1979, and expiring on September 30, 1980. Project tasks included development of a national communications network; preparation, publication, and dissemination of a preliminary questionnaire, an information fact sheet, and a comprehensive questionnaire; development of a data processing system; development of relationships with 20 Federal agencies for their use of the jobs / skills bank referral service; and followup of applicant referrals. Other project tasks involved solicitation of participation of Indian Federal employees, field test and implementation, and preparation of materials related to tribal employment rights programs. The jobs / skills bank staff provided consultation to the Federal Interagency Task Force on Indian Women and to other groups. The bank referred 60 of its 989 applicants, and 4 of the 60 persons referred were hired as a result of the referrals; thus a 6 percent placement rate was achieved. Recommendations concerning future support of a jobs / skills bank project are that future contracts provide for an adequate distribution of staff to allow for the identification of an ongoing communication with Federal and other employees and that project staff include a full - time director and assistants in both program and technical areas. Moreover, some provision should be made which would allow for the referral of persons, who are obviously well qualified for positions in the Federal Government, to vacancies even though no comprehensive questionnaires are available in their field of expertise. Tables are supplied. Questionnaires, job announcements, sample forms, flow charts, and supplementary material are appended.

Future of State and Local Pensions.
Final rept.,
Harold A. Hovey. Apr 81, 576p HUD-0002058
Grant HUD-H-2921RG
Prepared in cooperation with Winklevoss and Associates, Philadelphia, PA, and Government Finance Research Center, Washington, DC. Sponsored in part by Department of Health and Human Services, Washington, DC; Department of Labor, Washington, DC; National Inst. of Education, Washington, DC, and President's Commission on Pension Policy, Washington, DC.

This study examines major economic issues surrounding State and local pensions including the size of plan benefits, the costs associated with pension plans and funding alternatives, investments of plan assets, reporting and disclosure practices, and the financial burdens that the funding of pensions creates for State and local governments. The study was based on a sample of 100 State and local pension plans drawn from the universe of plans with 1,000 or more members. The sample covers just less than three - fourths of all State and local workers enrolled in pension plans. The study examines benefit levels and pension plan design including adequacy of benefits, impact of inflation, and social security. It found that on a weighted average basis, the 100 large State and local plans replaced 109 percent of final disposable working income for employees retiring after 30 years of service at age 65 with a salary of $10,000. The study also examines pensions costs and funding including advance funding, pension cost estimates, sensitivity to economic assumptions, measurement of current service costs, and methods dealing with unfunded liabilities. Funding policy for cost - of - living increases, employer and employee sharing of cost and risk, investment results, and alternative investments are discussed. In addition, the study analyzes reporting and disclosure practices and trends and issues in plan design such as the effect of shifting age distributions on payroll increases and the increasing costs of pension contributions in the cities of New York City, N.Y., Chicago, Ill., Los Angeles, Calif., Philadelphia, Pa., Detroit, Mich., Baltimore, Md., and Houston and Dallas, Tex. A glossary is included.

Crisis Intervention Training for Public Housing Residents and Staff: A Report on a Demonstration Program.
Final rept.
Jul 81, 46p HUD-0002131
Contract HUD-H-5186CA

This report describes a demonstration program in crisis intervention training for public housing residents and staff. The program was designed to increase the ability of residents and management staff to deal with the crises that face people who work and live in public housing. The program modified and adapted accepted forms of crisis intervention to public housing circumstances, and demonstrated this concept in Baltimore, Md. Such factors as the setting, the background and qualifications of participants, and the scope and purpose of the curriculum are described. The concluding section of the report presents lessons and guidelines that emerged from this experience. In contrast to the usual crisis intervention approach, the program was based on awareness that crisis is endemic to public housing residents, not an isolated event. Thus, the program's goal was to prepare crisis intervention facilitators who lived and would remain in the community, rather than outside support persons who would render assistance and leave. The training thus emphasized a process rather than directed solutions and was anchored in the crises trainees saw in their lives. Trainee reaction to the program was positive. Trainees gained an understanding of their reactions to stress and alternative ways of handling stress situations. Costs of the program, if implemented elsewhere, are deemed minimal if the guidelines developed here are followed. It is suggested that time and effort be expended toward recruiting trainers and organizing the program so that residents are informed of it. Charts, tables, and training instruments are provided.

The Formation of Homogeneous Item Sets When Guessing is a Factor in Item Responses.
Research rept.,
Mark D. Reckase. Aug 81, 94p Rept no. RR-81-5
Contract N00014-77-C-0097

One of the major assumptions of latent trait theory is that the items in a test measure a single dimension. This report describes an investigation of procedures for forming a set of items that meet this assumption. Factor analysis, nonmetric multidimensional scaling, cluster analysis and latent trait analysis were applied to simulated and real test data to determine which technique could best form an unidimensional set of items. Theoretical and empirical evaluations were also made of the effects of guessing on the dimensionality of test data. The results indicated that guessing affected highly discriminating items more so than poorly discriminating items. However, the effect of guessing on the dimensionality of tests with common distributions of difficulty and discrimination indices was found to be minimal. Of the procedures evaluated for sorting items into unidimensional item sets, principal factor analysis of phi coefficients gave the best results overall. Nonmetric multidimensional scaling also showed promise when used with Yule's Y, phi, or tetrachoric similarity coefficients, but it did not perform as well as the factor analytic techniques on the real test data. In summary, guessing does have an effect on test data, but the effect is not very large unless items of extreme difficulty are present in the test. Of the procedures evaluated, traditional factor analytic techniques gave the most useful information for sorting test items into homogeneous sets. (Author)

Procedures for Criterion Referenced Tailored Testing.
Final rept. 1977-1981,
Mark D. Reckase. Aug 81, 25p
Contract N00014-77-C-0097

This report summarizes the research findings of a four-year contract investigating the applicablity of item response theory and tailored testing to criterion-referenced measurement. Six major areas were studied on the project. These included: (a) techniques for forming unidimensional item sets, (b) techniques for calibrating items, (c) item parameter linking procedures, (d) comparisons of latent trait models, (e) tailored testing procedures, and (f) decision making procedures. The results showed that factor analytic procedures were best at forming unidimensional item pools, the LOGIST calibration program performed slightly better than the ANCILLES program for item calibration, the maximum likelihood procedure using the LOGIST program generally gave the best linking, the three-parameter logistic model was preferred to the one-parameter model for tailored testing applications, the maximum likelihood based tailored testing procedure was slightly preferred to the Owen's Bayesian based procedure, and the use of the sequential probability ratio test with tailored testing resulted in substantial savings in test length. Overall, tailored testing was shown to be feasible for achievement testing applications. More detailed results are described in the papers and reports listed in this report. (Author)

Target Information Processing: The Effects on Reaction Time of Terrain, Downlook Angle, and Response Processing Level.
Technical rept.,
Richard M. Johnson. Oct 80, 29p Rept no. ARI-TR-480

This experiment explored the applicability of a serial exhaustive memory scan as a model of the observer's cognitive behavior in a target acquisition task. Reaction times were examined for identification, recognition (friend-enemy), and set responses to stimulus scenes consisting of armored vehicles varying in background (forest, road, or plain) and downlook angle (10 de-

grees, 20 degrees, or 30 degrees). Positive set size was either one, two, or four vehicles. The results provided support for the serial exhaustive model in the linear set size function with a zero intercept of 1.4 seconds (s) and a slope of .2 s. Parallel functions were obtained for the forest condition adding .2 s over the equivalent road and plain conditions. The 10 degrees downlook angle resulted in the slowest response times, and the 20 degrees angle the fastest. The response times were the fastest for the positive set items only, followed in order by recognition and identification responses. (Author)

RAND Corp., Santa Monica, CA.
Spatial Learning and Reasoning Skill.
Interim rept. Jul 79-Jul 81,
Sarah E. Goldin, and Perry W. Thorndyke. Jul 81, 28p Rept no. RAND/R-2805-ARMY
Contract MDA903-79-C-0549
See also Rept. no. RAND/N-1595-ONR dated Dec 80, AD-A094 829.

A series of studies undertaken to identify skills required for successful spatial performance. A Study of requirements for distance estimation, self-orientation, and object location tasks supported our assumption that the type of spatial knowledge acquired depends on the learner's information source. A second study showed that filmed traversal of an unfamiliar route provides as much knowledge about landmarks, landmark sequence, and distances as a live tour, but not sufficient information about angles of turns to allow accurate self-orientation. Studies of cognitive mapping skill showed that good mappers excel at acquiring knowledge from navigation or maps, at manipulating information in memory, and in visual memory, visualization, and spatial orientation ability. Good and poor mappers do not differ in map reading, map interpretation, or navigation skill. Examination of two different strategies for learning a new environment from navigation indicated potential benefits from training strategies compatible with the learner's abilities. (Author)

As Parents Go, So Go the Children. The Development and Adjustment of Children in the Military.
Interim rept.,
Edna J. Hunter, and Robert A. Hickman. 15 Jun 81, 36p Rept no. USIU-TR-81-01
Contract N00014-79-C-0519
See also AD-A093 811.

A review of military family research accomplished prior to 1980 indicates that almost one-half the total literature on military child adjustment and development deals with topics on father absence, family reunion/reintegration, adjustment to loss, adjustment to divergent cultures, mixed marriages, child abuse, relocation, childcare, and the impact of the prisoner of war experience on parental relations with children. The military lifestyle presents both opportunities for growth as well as family crises which engender problems for a developing child. Perhaps the two major findings emanating from most of these studies are that: (1) the mother fills a more critical family role within the military family than she does in civilian life, and (2) the children's adjustment is a direct reflection of how successfully the mother copes with the unique stresses posed by the military lifestyle. Cerebral Economics: Resource Competition within but not Between Hemispheres.
Technical rept.,
Alinda Friedman, Martha Campbell Polson, and Cameron G. Dafoe. Jun 81, 49p Rept no. TR-3
Contract N00014-79-C-0679
Prepared in cooperation with Alberta Univ.

In this paper, we test a model in which it is assumed that the left and right cerebral hemispheres have access to independent supplies of resources, which they may each use in most kinds of information processing situations. Eight male subjects were specifically selected for having demonstrated a strong right-hand superiority on several manual tasks, and a strong RVF-LH superiority for processing the stimuli we would be using as a verbal memory load in a dual-task situation. Their performance was then measured on the memory load task, on a target task in which pairs of stimuli were presented to either visual field and subjects performed physical or name identity judgments, and in a situation in which both tasks were combined. In our approach, right and left visual field trials of the target task combined with the verbal memory load are treated as two different dual-task situations, comprising cases of complete vs. no overlap in demand for left hemisphere resources, respectively. Subjects were paid for both single and dual-task performance; in the latter case, the payoff ratios rewarded them more for either their memory or target task accuracy. Decrements from single-task performance were less severe on both tasks when subjects were performing physical rather than name matches, and importantly, when the target stimuli were presented to the LVF rather than the RVF. The data support the idea that the resource supplies of the left and right hemispheres are independent, and have implications for both cerebral specialization and divided attention issues.

The Use of the Sequential Probability Ratio Test in Making Grade Classifications in Conjunction with Tailored Testing.
Research rept.,
Mark D. Reckase. Aug 81, 26p Rept no. RR-81-4
Contract N00014-77-C-0097

This report describes a study comparing the classification results obtained from a one-parameter and three-parameter logistic based tailored testing procedure used in conjunction with Wald's sequential probability ratio test (SPRT). Eighty-eight college students were classified into four grade categories using achievement test results obtained from tailored testing procedures based on maximum information item selection and maximum likelihood ability estimation. Tests were terminated using the SPRT procedure. The results of the study showed that the three-parameter logistic based procedure had higher decision consistency than the one-parameter based procedure when classifications were repeated after one week. Both procedures required fewer items for classification into grade categories than a traditional test over the same material. The three-parameter procedure required the fewest items of all, using an average of 12 to 13 items to assign a grade. (Author)

Analysis of the Decision and Verification Stock-market Tasks Using Additive Stage Process Methods.
Technical rept. 1 Jan-30 Jun 81,
Murray Singer. Jun 81, 36p Rept no. ICS-TR-107-ONR
Contract N00014-78-C-0433

Two additive stage processing models are presented that address some of the tasks reported in Antos, Kozminsky, Bourne, and Kintsch (1981). The development and application of these models to information analysis and decision procedures demonstrates their usefulness in structuring thinking and experimental design about critical, complex, real-life sorts of decisions. Both alternative processing models presented were constructed by carefully thinking out what mental operations are necessary to perform information analysis, decision and verification. Predictions are generated from the models and those predictions were compared to the data reported in Antos, et al. While some predictions of the model are supported, new experiments are needed to test more critical predictions. The intention of this work is to lay some of the theoretical groundwork for designing experiments that would provide information on the critical elements in how people understand facts in order to make decisions. Effects of Time-Varying Noise on Annoyance: A Review,
Simone L. Yaniv, Jay W. Bauer, Daniel R. Flynn, and William F. Danner. Oct 81, 64p NBSIR-81-2377
Sponsored in part by Federal Highway Administration, Washington, DC.

The report summarizes the literature dealing with the adverse response of people to time-varying noise, and identifies both the acoustical and non-acoustical factors that influence the relationship between time-varying noise and annoyance. An examination of the laboratory research concerned with the functional relationship between annoyance and the temporal and acoustic parameters of noise shows the tenuousness of such relationships. The adequacy of currently used and/or proposed rating procedures for predicting subjective response to time-varying noise is examined. Critical gaps in current knowledge are identified.

Inquiry into the Status of a Proposal to Construct 16 Single-Family Detached Homes for the Cuyahoga Metropolitan Housing Authority in Cleveland, Ohio.
30 Jul 81, 7p Rept no. GAO/CED-81-147

The purpose of this review was to examine the status of a proposal to construct 16 single-family detached homes for rental to lower income persons for CMHA. Specifically we gathered and analyzed information on the status of The Dillon Company's proposal to construct the units, actions that must be taken before the proposal is approved by HUD, and preliminary costs proposed by The Dillon Company to construct the units. We made our review at CMHA's headquarters and HUD's office in Cleveland, Ohio. We reviewed project files and interviewed CMHA and HUD officials. We also contacted the person who appraised the proposed project for a Cleveland city councilman. We visited the proposed site of the units and toured the surrounding neighborhood. (Author)

Family Roles in Transition. In a Changing Military.
Interim rept.,
Edna J. Hunter, and Melissa A. Pope. 18 Jun 81, 28p Rept no. USIU-TR-81-02
Contract N00014-79-C-0519

The military is no longer a single man's occupation; today there are increasing numbers of married service personnel and active duty women. A review of the literature on changing roles and structures within the military family indicates that although only one member of the marital dyad may actually be employed by the military, this organization places heavy demands upon both marital partners. Although much of the earlier research on this topic outlined proper roles for the traditional military family members, more recent articles focus on changing roles for both men and women in society which are belatedly being reflected within the military, and thus creating new problems for mission accomplishment. Ironically, as the research points out, the military requires independent dependents if the family is to cope successfully with frequent family separations. The major focus of existing research has been problem-oriented and has dealt with the unique stresses placed upon military family members, which require flexibility of family roles. (Author)

Military Retention and Retirement. Reciprocal Family/Organization Effects,
Robert A. Hickman, and Edna J. Hunter. 30 Jun 81, 24p Rept no. USIU-TR-81-03
Contract N00014-79-C-0519
See also AD-A093 811.

A review of all research on military families available in 1980 revealed that only recently have the topics of family factors in retention and the effects of retirement on family members been addressed. This article reviews work which has been carried out on spousal attitudes towards the military and the family member's commitment to the organization, work which reviews those two variables as significant influences on the retention decisions of active duty service personnel. Also addressed in the literature are newer areas of interest to researchers such as the retention decisions of active duty women and the focus by military planners on family issues in military mission accomplishment subsequent to the advent of the All Volunteer Force. The literature on retirement from the military after 20 to 30 year careers has centered on the adjustment problems which family members are required to make during this occupational transition, their relative success in coping with this crisis, and the assistance or lack of assistance provided by the military organization in helping the family in its effort to cope.

Interpersonal Relations Among Hispanics in the United States: A Content Analysis of the Social Science Literature.
Interim technical rept.,
Judith Lisansky. Oct 81, 291p Rept no. TR-3
Contract N00014-80-C-0407

This report is a comprehensive review of the social science literature on interpersonal relations among Hispanics in the United States. The materials were content analyzed in terms of a series of dimensions of intercultural variation (Triandis, 1981) which have been found to be highly relevant to interpersonal relations. Topics covered include thought patterns, basic value orientations, aspects of identification and social differentiations. The literature indicates that there is little consensus on many of the dimensions explored and suggests numerous hypotheses for further research. Some authors argue for subcultural differences, others assert that major changes are occurring, and still others warn against attributing specific cultural attributes to Hispanics. Similiarities and differences among the various Hispanic groups were also examined, focusing primarily on Mexican Americans, Puerto Ricans and Cubans. (Author)

The Army Racial Awareness Program: A Case Study of Program Impact on Personal Values.
Special rept.,
Michael R. Vaughan, and Richard E. Kriner. Apr 75, 30p Rept no. HUMRRO-SR-CD(L)-75-2
Contract DAHC19-73-C-0004

The effects of two forms of presentation of the Army Racial Awareness Program (RAP) on the personal values of equality and freedom were assessed. Subjects were army personnel assigned to RAP at Fort Meade, Md. The research instrument was the Rokeach Value Survey, in pretest-posttest administrations. Results suggested that the official RAP presentation version-lecture and discussion-was more effective than a lecture-only version in changing personal values. Importance attached to equality was increased among RAP participants but not among lecture-only subjects. Importance attached to freedom was relatively unaffected in both groups. The size and statistical significance of value change among RAP participants varied according to characteristics such as age, race, rank, and education. Such differences were not found among lecture-only subjects. Subjects indicated approval of the RAP program and its continuance for all Army personnel.

A Methodology for Evaluating Housing in Use: A Case Study Approach,
Stephen T. Margulis. Jun 81, 225p NBSIR-81-2258
Sponsored in part by Department of Housing and Urban Development, Washington, DC. Office of Policy Development and Research. THIS DOCUMENT WAS ANNOUNCED PREVIOUSLY IN ISSUE 8201. It is being reannounced with a price change.

The National Bureau of Standards (NBS) has prepared a report on the methodology of Project Feedback, the evaluation of Operation Breakthrough housing in use (a post-occupancy housing evaluation). The report introduces housing evaluations and encourages their use by providing both housing questionnaires and a nontechnical, practical discussion of research methods in general and of survey research in particular. To increase the sophistication of housing evaluation research designs, the report includes a tested approach for selecting control group respondents for housing evaluations. In addition, it summarizes results of NBS's housing evaluations, principally to illustrate ways of categorizing (coding) occupants' answers, but also to introduce these studies and their results. The case study approach is meant to encourage readers to build on NBS's experiences.

The Networkers Network: A Study of the Impact of a New Communications Medium on Sociometric Structure.
Final rept. 30 Sep 77-31 Dec 79,
Sue C. Freeman, and Linton C. Freeman. 1981, 74p
Grant NSF-DSI77-16578

Forty social scientists and mathematicians, all concerned with problems in the study of social networks, were linked together by means of a computer to facilitate their interpersonal communication. The present paper presents the early results of this experiment. Interpersonal linkage patterns among participants prior to the start of the experiment were used as a 'base line' from which the impact of this unique medium of communication was examined. The authors attempt to uncover some of the dimensions of sociometric patterns as they have developed through and around the computer based network of networkers.

The Income and Production of Guyana Rural Farm Households: An Analysis Based on the 1979 Guyana Rural Farm Household Survey.
Apr 80, 158p AID-PN-AAH-642
Contract AID-504-INST-781

Obtaining a clear picture of the economic well-being of farm households in Guyana is a prerequisite for providing assistance to the country's poorest and neediest farmers. To this end, the results of a survey of the income and production of Guyana's rural farm households for the year 1978 as derived from interviews of individuals from these families, are presented in this report. Major findings of this report include: (1) four-fifths of rural farm households had annual incomes below Guyana's target level for development assistance; (2) two-thirds of rural farm household income came from off-farm sources; (3) one-third of farm households reported difficulty in obtaining needed production and service inputs for rice production; (4) irrigation systems and conditions were better on non-target farms than on target farms. Based on these findings, the following basic program and policy directives aimed at raising rural farm income are set forth: (1) increasing government support for rural households; (2) encouraging farmers to increase the amount of land under cultivation; (3) improving on-farm water control; (4) creating more opportunities for off-farm employment.

Third Evaluation of the Thailand National Family Planning Program.
Program evaluation rept. no. 3,
Donald Minkler, and Debhanom Muangman. Feb 80, 125p AID-PN-AAJ-314
Contract AID-pha-C-1100

Since the development of the first family planning (FP) project implemented in Thailand in 1968, great progress has been made there in FP and the use of contraceptives. The NFPP has had the folowing significant impact upon population growth: contraceptive use, especially of the pill, has increased substantially since the commencement of NFPP; fertility is decreasing faster in rural areas than in urban areas; the steady decline in the fertility rates since the mid-1960's has accelerated since NFPP began; and the population growth rate has decreased from 3.6% to 2.6% during 1960-75. For the success of this program to continue, increased support is required from the Royal Thai Government (RTG) and international donors. Other recommendations arising from this evaluation include: (1) giving priority to geographic regions and subpopulations where FP acceptance is low; (2) emphasizing improved management and supervision at the village level; (3) including information about FP in health education programs; (4) giving all health education personnel rural health; (5)evalution the impact of NFPP on health status, (6) continuing pilot projects to determine the use of nonphysician personnel in FP service delivery and (7) continuing subsidy to RTG.

Case Studies of the Impact of Federal Aid on Major Cities: City of Cleveland.
Final rept.,
Richard F. Tompkins, Peggy Twohig, JoAnn Fitzpatrick, Susan Lajoie, and James Coke. Feb 81, 129p FEDERAL AID CASE STUDIES SER PAPER-10, MEL-81-19
Grant DL-23-11-77-03

The report is one of a series of studies of how particular large cities have used federal aid, with emphasis on the 1977-78 economic stimulus expansion of the federal grants for public service employment, local public works, and antirecession fiscal assistance. The studies use a common analytic framework to enable comparison across cities with differing economic, budgetary, and political circumstances. Each of the studies traces growth and uses of federal aid in the 1970s and seeks to respond to four types of questions: (1) To what extent have cities become dependent on federal grants to pay for basic services. (2) Has the Carter Administration's Economic Stimulus Program of 1977-78 helped reduce unemployment. (3) Who benefits from the federally supported programs. (4) Who at the local level decides how the federal aid money is spent.

Daytop Village, Inc., New York.
Advancement in Drug Free Therapeutic Community Treatment.
Evaluation rept.,
D. Vincent Biase. Mar 81, 190p
Sponsored in part by National Inst. on Drug Abuse, Rockville, MD.

Daytop Village's Miniversity is an experiment which represents a significant advancement in the type of educational program available in therapeutic communities. Therapeutic communities develop educational programs for three primary reasons. First, and most simply, education is valued in and of itself. At a more practical level, therapeutic communities develop educational programs because they seem essential to re-entry. Third, educational programs are viewed as an adjunct to treatment. Like the other educational programs offered at therapeutic communities, Daytop's Miniversity grew from these rationales. The Miniversity, however, was designed to go beyond these programs and to fill a gap in them. This survey of thirteen major T.C. programs represented nine states with significant numbers of treatment slots for the drug free residential modality/environment. The States represented were New York; California; Pennsylvania; Illinois; Michigan; Massachusetts; Connecticut; New Jersey and Rhode Island. The average age of residents ranged from 14.5 years to 27 years.

A Preliminary Study in Three Countries: Indonesia Report,
Pauline Milone. Sep 78, 306p AID-PN-AAH-417
Grant AID/otr-G-1477

In Indonesia, a country of over 300 ethnic groups, the enormous diversity of language, religion, education, culture, and custom makes the term Indonesian woman inadequate. This paper documents the social, legal, and economic status of Indonesia's 66 million women without neglecting ethnic differences. The first section describes the country's Islamic, Christian, and commonlaw marriage customs, which impact on every aspect of a woman's existence. The history of Indonesia's women's movement, especially in eliminating child and forced marriages, polygamy, and husband-initiated arbitrary divorce are discussed. This is followed by a portrayal of the difficulties faced by women - particularly the young and/or unmarried - in achieving equal status under the law in regard to child custody, property ownership, control of income, tax liability, access to credit, political participation, and educational opportunities. Also included are the many factors responsible for the high rates of female anemia/malnutrition and maternal mortality, women's communications networks, economic and demographic profiles of women, and the author's impressions of the effects of modernization on women.

Results of Fingerprint Image Quality Experiments,
R. T. Moore. Jun 81, 50p NBSIR-81-2298
Sponsored in part by Federal Bureau of Investigation, Washington, DC.

A series of experiments were conducted to determine the variation in the scores developed using a matching algorithm designated as the M-82 for mating fingerprints of different image quality that had been read by the Automatic Fingerprint Reader System (AFRS) of the FBI. The variations in image quality resulted from the use of a variety of card stocks and recording techniques to record the print of a single finger. For each image recording process, a sample of 56 finger-pairs were matched and mean single-finger score values were developed. These varied over a factor of more than 70 to one. The best scores were developed from images placed on very white, slick appearing, calendared card stock with the use of film strips that had been pre-inked and which could be separated to expose an ink film of predetermined thickness and uniformity. This combination had less resistance to smearing than fingerprints produced on the same stock from the use of a preinked porous pad. However, the latter still produced acceptably high scores.

Housing Demand Models and Housing Market Models for Regional and Local Planning,
Bjoern Harsman. 1981, 268p D13:1981, ISBN-91-540-3538-X

The authority mainly responsible for housing provision in Sweden is the local government. Every year each municipality has to work out a program for the development of the housing stock during the next five years. These plans are then used by the national government to decide on an upper limit for the future volume of

housing investment in different regions. The major purpose of this study is to offer methods that can be used in housing planning at the local and regional level. A disaggregated approach is used. Housing is regarded as an indivisible commodity characterized by several attributes and different household categories are distinguished. A model package is presented which consists of a household formation model, a housing demand model and a model for depicting the competition in the housing market. An exogenous population forecast at the regional level is the basis for the model package. The number of dwellings demanded is obtained by the household formation model and the demand model spells out what dwelling types various households demand. In the housing market model this demand is confronted with an exogenously given supply. The output is a pattern of housing consumption and a set of variables indicating imbalances in the market.

Requests for Federal Disaster Assistance Need Better Evaluation.
Report to the Congress.
Dec 81, 66p CED-82-4

Since 1970 the President's Disaster Relief Fund has provided over $3.8 billion to individuals and State and local governments. The Federal Emergency Management Agency, in assessing eligibility for disaster assistance, has had difficulty in determining whether State and local governments are capable of handling their own disasters and whether they are committing a reasonable amount of their available funds for disaster relief. GAO also found that the Agency has adopted a controversial cost-sharing policy and has funded other than natural disasters. GAO recommends that the Congress clarify (1) the extent of supplemental Federal assistance to be given and (2) what kinds of disasters are eligible for Federal assistance. The Federal Emergency Management Agency should analyze the impact potential State inequities have on Federal disaster assistance and submit a detailed plan and legislative changes to the Congress to correct such weaknesses.

A Survey of Citizen Views and Concerns About Urban Life.
Final rept.
Feb 78, 284p STUDY-P2795
Contract HUD-H-2835
Supersedes PB-300 154.Portions of this document are not fully legible.

The American city is the place in which society's economic, cultural, and intellectual needs--though not its residential needs--can best be met. That is one of the interesting findings that have resulted from this survey of citizen views about urban life conducted by Louis Harris and Associates. The survey, completed in January 1978, provided citizen input into the President's 1978 report to the Congress on urban policy. More than 7,000 citizens in urban, suburban, and rural areas throughout the country were asked to give their views on the present condition and future prospects of their communities. This publication, here reprinted, outlines the survey's general findings.

Post Occupancy Evaluation of Housing.
Final rept.,
Robert B. Bechtel, and Rajendra K. Srivastava. Dec 78, 521p HUD-0000815
Contract HUD-H-2405

Post occupancy Evaluations (POE's) are evaluations made to buildings after they have been occupied for some length of time. They are evaluations from the viewpoint of the people who use the building, including residents, visitors, managers, and maintenance personnel. This report deals with POE's of housing for HUD and is organized into 14 tasks. Study results revealed that although over 1,000 professionals were surveyed throughout the United States, only 31 housing agencies had ever done POE's and of these, not a single one had incorporated POE's within their programs. A total of 499 persons and 169 organizations were found to have expertise in performing POE's. Of the 1,305 studies reviewed, only 265 in the United States had sufficient data for analysis. Most of the 265 were conducted in the northeastern States and California. Lack of involvement by housing - related professionals with housing after it has been built was seen as the most relevant constraint to use of POE's. Current attitudes toward POE's show that POE's should cover health and safety first and that POE's primary objective should be to improve future housing design. A clearinghouse strategy is proposed to identify, develop, and overcome past constraints to the use of POE's. POE's are outlined for HUD's largest programs: Multifamily Mortgage Insurance, Section 8 New Construction, and Turnkey Public Housing. The report recommends that POE training packages should be developed and that HUD should mandate the use of POE's in all housing programs. About 90 tables, 8 figures, and 7 exhibits are included. Five appendices list individuals and organizations with POE expertise, an international bibliography of POE evaluations, a POE questionnaire, a POE fact sheet, and POE topics. (Author abstract modified).

Annual Housing Survey: 1973. Housing Characteristics of Older Americans in the United States.
Aug 79, 226p HUD-0000947, HUD/PDR-501/1
Sponsored in part by Administration on Aging, Washington, DC.
Paper copy available from Supt. of Docs., Washington, DC 20402, order number 023-000-00535-2.

Data from the 1973 Annual Housing Survey conducted by HUD are used as the basis for this report presenting detailed statistics on the housing characteristics and neighborhood conditions for all U.S. households headed by persons aged 62 - 64 and 65 and over. Data for the housing and household characteristics are shown by standard metropolitan statistical areas, income level, value of owned housing units, gross rent categories, and characteristics of recent movers. About one - fifth of the 69.3 million occupied housing units in the United States in 1973 were households headed by a person aged 65 or older. Of these households, over 9.3 million were owner - occupied and 4 million were occupied by renters. The main type of housing for households headed by older persons was the single - family home. The majority of the dwellings for this age group were built in 1939 or earlier. Almost one - tenth of the renter - occupied dwellings lacked some or all plumbing facilities. Owner - occupied units had about 1.5 times the number of rooms as renter - occupied units. Street noise and heavy traffic were the most common neighborhood problems cited. Housing occupied by recent movers tended to be newer than the other housing. Change in housing needs was most often cited as the motivation for moving to a different dwelling. Family status was the second most common reason and included such factors as becoming widowed, moving closer to relatives, and a decrease in family size. Extensive tables and appendices presenting the study instrument and background information on the study design are provided. (Author abstract modified).

Women and Mortgage Credit: An Annotated Bibliography,
Emily Card. Mar 79, 110p HUD-0001714
Contract HUD-H-5250-79

The second section of a two - part report, this work consists of an annotated bibliography of agency information packages and the results of a literature search of materials dealing with housing and mortgage credit for women. The report summarizes the state - of - the - art of Federal agencies charged with Equal Credit Opportunity Act enforcement. To obtain the citations listed herein, an extensive search was made of numerous sources. Approximately 20,000 entries were scanned in the Library of Congress centralized bibliographic indexes, several computer - based information systems were accessed, and agencies with enforcement responsibilities were contacted. Private organizations, public interest grups, and congressional staff members were also queried The search revealed that the number of journal articles, monographs, or Government publications relating directly to women and mortgage loans or housing problems was limited. Rather, most sources on housing and mortgage discrimination dealt with the issue of race discrimination and redlining. Sources identified herein are grouped according to the following subject categories: mortgages, housing and home ownership, consumer credit, enforcement of nondiscriminatory credit practices, families, women in the economy, banking, statutes, and bibliographies. Descriptors, where appropriate, have been added, and some reference materials have been cited without annotations. Recent entries are emphasized. Several recurring themes are apparent in the bibliography. For example, women's income levels are a critical factor in assessing women's access to the housing market. In major metropolitan areas, an income of almost $20,000 is needed annually for a median - priced house purchase, yet one study showed that 50 percent of all working women make less than $6,000 per year. The picture is somewhat bleaker for the female single parent; one - third of families headed by women are below the poverty level. In addition, lending practices tend to be overly conservative in view of women's present economic role, particular regarding the income potential of families with working husbands and wives. In general, women's participation in housing purchases has been insufficiently charted and evaluated. The extensive bibliography, with most reference works published between 1972 - 78, constitutes the bulk of the report.

American Bar Association, Washington, DC. National Housing Justice and Field Assistance Program.
National Housing Justice and Field Assistance Program. Quarterly Information Bulletin, Issue Five, Fall 1980.
1980, 10p HUD-0001816
Sponsored in part by Federal Emergency Management Agency, Washington, DC.

Issues bearing upon housing and building fire safety are reported in this edition of a quarterly information bulletin concerned with justice for consumers in housing. A study of building code enforcement with emphasis on fire and life safety is announced. This national study is sponsored jointly by the American Bar Association and the U.S. Fire Administration / Federal Emergency Management Agency. The primary focus of the study will be on fire and life safety components of local and State codes. Initial operation of the National Center for Community Code Compliance is also reported. This organization offers funding and technical assistance for communities and groups concerned about upgrading fire and life safety codes and their enforcement within their jurisdictions. A segment presented by the International Association of Fire Chiefs advises that in a climate of reduced resources for fire departments, emphasis must be placed on fire prevention, primarily through the effective formulation and enforcement of fire codes. Among other issues and programs examined are legal considerations in retrospective building regulations and a fire inspection management guidelines project.

Housing Deprivation Among Enrollees in the Housing Allowance Demand Experiment.
David W. Budding. Jun 80, 257p AAI-78/133, HUD-0001839
Contract HUD-H-2040R

The incidence and nature of housing deprivation are described for low - income and poverty renters at the time of their enrollment in the Housing Allowance Demand Experiment, a test of the concept of direct cash assistance to low - income households enabling them to rent suitable housing. The experiment tested a variety of allowance plans involving about 1,200 experimental households and 500 control households at two sites (Allegheny County, Pa., and Maricopa County, Ariz.) during 1973 - 1977. Each household enrolled in the experiment was offered allowance payments for 3 years. Analysis is based on data from the first 2 years. This report's focus is on physical housing deprivation of clients' housing at the time of enrollment. Each dwelling unit was inspected by a trained

evaluator. By gathering extensive information on the physical condition of dwelling units through this method, estimates of inadequate housing sharply increased over those produced by traditional measures. The incidence of housing deprivation, crowding, and rent burden were found to be related to household size and income, with the incidence of housing deprivation being greatest among the very poor. Traditional measures of crowding and rent burden are also indicated to be inadequate. Tabular and graphic data, footnotes, and chapter references are provided. Appended material explains the design of the demand experiment, the development of the measure used, housing needs, and site detail. (Author abstract modified).

Annual Housing Survey 1978. United States and Regions. Housing Characteristics of Recent Movers.
May 81, 178p HUD-0002051
Paper copy available from Supt. of Docs., Washington, DC 20402, order number 003-024-02676-7.

This report presents cross - tabulations on the housing characteristics of units occupied by 'recent movers' from the 1978 Annual Housing Survey. Statistics are presented for the United States by inside and outside standard metropolitan statistical areas (SMSA's) and each of the four geographic regions. Households that moved into their units during the 12 months prior to the interviews are classified as recent movers. Individual tables present characteristics of all occupied housing units and units occupied by recent movers. They also give data for 'specified owner occupied,' recent mover households cross - tabulating family and primary individual income by the purchase price of the recently acquired home. Other tables present characteristics of the present unit for recent mover households cross - tabulated by the characteristic of the previous unit. The same subject content in these tables is presented for housing units with black heads of households and for housing units with heads of households of Spanish origin. Appendices describe the geographic area classifications and provide definitions and explanations of the subjects covered in the report, as well as information on sample design, estimation, and accuracy of data. Maps are provided. (Author abstract modified).

Fair Market Rents (FMRs) for Existing Dwellings: An Evaluation Through Hedonic Index Methods,
Larry Ozanne, and Thomas Thibodeau. May 81, 77p HUD-0002054
Contract HUD-H-2882

Findings are reported from an application of hedonic index methods to an evaluation of 'fair market rents' (FMR's) in the existing housing portion of Section 8 of the 1974 Housing and Community Development Act, which authorizes housing assistance payments for lower income families. HUD is charged with establishing FMR's for dwellings appropriate for assisted families. HUD currently sets unit FMR's for each Standard Metropolitan Statistical Area (SMSA) and for each nonmetropolitan county, using the metropolitan Annual Housing Survey (AHS) to provide the basic data. Median rent for recently occupied two - bedroom units without defects is obtained from each SMSA survey and updated by the Consumer Price Index. FMR's for bedroom sizes other than two are set by using a 15 - percent differential per bedroom. The proposed hedonic method yields a site - specific formula for predicting average market rents at all bedroom sizes for each SMSA, using data from the AHS. The formula tests the statistical importance of adjustments to market rents representing central city or suburban locations, single family or multifamily buildings, as well as many other distinctions. The hedonic index method also provides ranges of probable error for all predicted rents. The comparison of FMR schedules from the hedonic method with actual FMR's shows that HUD's median rent procedure leads to an overstatement of the market rent for dwellings meeting Section 8 housing standards. On average, HUD's 15 - percent bedroom differential permits additional space and features beyond another bedroom. The hedonic procedure can be used to set differentials reflecting additional bedrooms and other necessary additions. Rental price differences among SMSA's are analyzed, and a model of metropolitan housing markets is presented. A reduced form equation for rental prices is also estimated. Tabular data are supplied, and supplementary information is appended. Seven references are listed.

Artists Foundation, Inc., Boston, MA.
Artists' Spaces: A Study of the Development of Artists' Living and Working Space in Boston,
Theodore C. Landsmark. 01 Mar 81, 138p HUD-0002076
Grant HUD-H-5124RG

This report on the efforts of the Artists Foundation to develop affordable living and working spaces for artists in the greater Boston area explains how deteriorating neighborhoods can be revitalized by converting vacant warehouse and industrial buildings into artists' lofts and studios. The history and justification for the connection between the arts community and neighborhood revitalization are examined, along with the advantages and disadvantages of concentrating artists within neighborhoods. An assessment of the requirements for space for various sectors of the arts community shows that the building selected for studio loft space should have central stairways, easy - to - follow common hallways, freight elevators, and fire escapes. The overall floor plan should include from 1,500 square feet to 3,000 square feet of high - ceilinged space per artist. Each floor should be equipped with common conveniences for collective use. The case study of the foundation's Art Space Project, Inc., delineates the problems encountered and solutions found to converting the building at 86 South Street, Boston, into condominiums providing artists with living and working space. The completion and full occupancy of the project without public subsidies serves as a model of what can be accomplished through creative development. A bibliography of about 200 references, the artists space survey findings, plans for 86 South Street, financing strategies, and other related material are appended.

Selling the Solar Home '80: Market Findings for the Housing Industry.
Jan 80, 36p HUD-0002077, HUD/PDR-514
Contract HUD-H-2372
Sponsored in part by the Department of Energy, Washington, DC.
Paper copy available from Supt. of Docs., Washington, DC 20402, order number 023-000-00568-9.

This is the second report on marketing experiences in the HUD residential solar heating and cooling demonstration program, which supports many different types of solar projects and collects data on their performance and on the experiences of builders in marketing these projects. The study of market factors affecting the acceptance and sale of solar homes is intended to assist and encourage builders interested in including solar energy in future projects. The data are based on a small sample of HUD projects awarded in three cycles between January 1976 and May 1977. The market data collection process involved field visits to each site and comprehensive interviews with key actors in the construction and marketing process; with local government officials in the building code department, tax assessor's office, and zoning agency; and with the purchasers of the solar homes. For comparison purposes, interviews were also held with builders and buyers of conventional homes. Followup interviews were held with the purchasers of the solar homes at 6 - month intervals to determine levels of satisfaction, obtain information on energy use and utility costs, and identify attitudes toward solar energy. Questions were also asked about the operation, performance and maintenance of the solar systems. The solar outlook is seen as encouraging, with three - quarters of builders willing to construct additional solar homes outside the HUD program. The trend has shifted from active to passive solar design. Further study is recommended to determine frequency and cost of repairs and to document energy savings and relate these savings to operating expenses and the initial system cost. Illustrations and tabular data are provided.

Annual Housing Survey: 1977. Housing Characteristics for Selected Metropolitan Areas: Albany, Schenectady, Troy, N.Y. Standard Metropolitan Statistical Area.
Aug 80, 378p HUD-0002087
Paper copy available from Supt. of Docs., Washington, DC 20402, order number 003-024-0294-7.

This report presents statistics on housing and household characteristics in the Albany - Schenectady - Troy, N.Y., Standard Metropolitan Statistical Area (SMSA). These statistics were derived from the 1977 - 78 Annual Housing Survey conducted in 20 selected SMSA's. The source of 1970 data shown in the report is tabulations from the 1970 Census of Population and Housing, and 1974 data were derived from the 1974 Annual Housing Survey. The report provides statistics on general housing characteristics for 1977, 1974, and 1970 and on indicators of housing and neighborhood quality for 1977. Additionally, housing characteristics cross - classified by indicators of housing and neighborhood quality for 1977. Additionally, housing characteristics are given for black and Spanish heads of households. Statistics also illustrate the changes that have occurred in the housing stock of this SMSA from 1974 to 1977. For example, a net gain of 10,200 housing units has been recorded since 1974, with about 4 percent of the total housing stock constructed since the 1975 survey. Appendices describe the geographic area classifications and provide definitions and explanations of the subjects covered in the report, as well as information on sample design, estimation, and accuracy of the data. Table finding guides and area maps also included. (Author abstract modified).

This report presents statistics on housing and household characteristics in the Los Angeles - Long Beach, Calif., Standard Metropolitan Statistical Area (SMSA). These statistics were derived from the 1977 - 78 Annual Housing Survey conducted in 20 selected SMSA's. The source of 1970 data shown in the report is tabulations from the 1970 Census of Population and Housing, and 1974 data were derived from the 1974 Annual Housing Survey. The report provides statistics on general housing characteristics for 1977, 1974, and 1970 and on indicators of housing and neighborhood quality for owner - occupied and renter - occupied housing units, on financial characteristics, on recent mover households, and on financial characteristics cross - classified by indicators of housing and neighborhood quality for 1977. Additionally, housing characteristics are given for black and Spanish heads of households. Statistics also illustrate the changes that have occurred in the housing stock in this SMSA from 1974 to 1977. For example, a net gain of 28,200 housing units has been recorded since 1974, as well as a net loss of 8,800 unspecified units. Appendices describe the geographic area classifications and provide definitions and explanations of the subjects covered in the report, as well as information on sample design, estimation, and accuracy of the data. Table finding guides and area maps are also included. (Author abstract modified).

Effect of Race on Opinions of Structure and Neighborhood Quality,
Stephen C. Casey. Nov 80, 61p HUD-0002098, HUD/PDR-625
Contract HUD-H-2429-78
Paper copy available from Supt. of Docs., Washington, DC 20402, order number 023-000-00655-3

Data from the Annual Housing Survey were used to examine racial variation in opinions of housing and neighborhood quality to determine whether they result from differences in attitude between whites and blacks within similar houses or neighborhoods. The study compared white and black mean ratings within the major tenurial categories, owner and renter, using regression equations for each race for owner and renter specification of structure and neighborhood quality. In addition, two analyses of specific variables, value of the structure and the neighborhood variable, were conducted. Results indicate that opinions of housing and immediate geographic area were significantly higher for whites than for blacks. These differences range from one - third to one - half of a point on a 4 - point scale. However, using regression equations reduces the race effect to a relatively insignificant level of about 0.15. Thus, overall, whites and blacks of similar income, housing amenities, and education report the conditions of the housing and neighborhood they occupy similarly. This is true for both owners and renters. Further analysis reveals that there appears to be no difference attributable solely to race in either owners' or renters' specification of housing quality. Thus, this result rebuts the theories that claim the existence of an inherent racial bias in expressed opinion of structure and neighborhood quality. Tables, 17 footnotes, and four references are supplied. Technical data are appended. (Author abstract modified).

Assessment of Urban County Performance: Community Development Block Grant Program.
Aug 80, 536p HUD-0002099, HUD/PDR-660
Contract HUD-H-2606
Paper copy available from Supt. of Docs., Washington, DC 20402, order number 023-000-00686-3

This report contains findings from a performance evaluation of urban counties participating in the Community Development Block Grant (CDBG) program. The research project assessed the performance of urban counties during their first 3 program years (1975 - 77) and involved onsite data collection in all 76 counties. In addition, an update study assessed urban county performance in the next 3 program years (1978 - 80). The original study resulted in these major thematic findings (1) the intergovernmental context of the urban county CDBG program presented major challenges and required substantial intergovernmental cooperation, (2) urban counties served primarily as a funding mechanism for nonentitlement cities, (3) urban counties were unable to develop and implement programs through a comprehensive planning process, (4) urban counties initially restrained their institutional commitments to the CDBG program, and (5) certain conditions which constrained urban county performance appeared to be changing so that continued improvement could be expected. The update analysis found that broad - based improvement was achieved by the 10 sampled counties in their performance levels, although performance remained modest in certain program aspects; and that most of the improvement in urban county performance can be traced to the increased CDBG experience of county and municipal program administrators coupled with new HUD regulations and policy directives. The report recommends that the Interlocal Cooperation Agreement (ICA) be strengthened by including provisions for cooperating jurisdictions' certification of acceptance and responsibility for Housing Assistance Plan (HAP) existing and new unit programs, certification of compliance with various Federal standards, and assurance of maximum feasible priority given to projects which will benefit low - income and moderate - income persons. Tables, figures, and appendices containing a description of project methodology, supporting data, and the service area method for calculating benefit to low - income and moderate - income areas are supplied.

This brochure details the major areas of the 1981 Research and Technology Budget submitted by the HUD Office of Policy Development and Research. These areas include research in housing assistance, housing safety and standards, consumer and equal opportunity, and community develoment, as well as housing economic data and analyses. In addition, the budget addresses energy conservation and standards research, program evaluation, and research program support and utilization. Program achievements have included the institution of a process for establishing research priorities, the engagement of noted scholars to reexamine the scope, quality, and gaps in existing research, and the improvement of career staff standards. Other achievements have included the introduction of visiting scholars for 1 - year terms, active involvement in research design and analysis of findings, and encouragement of participation by researchers in academic institutions. In addition, a substantially greater effort was made to disseminate research findings and to involve women and minorities in staff work and research. Tabular data are included.

Annual Housing Survey: 1977. Housing Characteristics for Selected Metropolitan Area: Anaheim, Santa Ana, Garden Grove, Calif. Standard Metropolitan Statistical Area.
Aug 80, 471p HUD-0002102
Paper copy available from Supt. of Docs., Washington, DC 20402, order number 003-024-02095-5.

This report presents statistics on housing and household characteristics in the Anaheim - Santa Ana - Garden Grove, Calif., Standard Metropolitan Statistical Area (SMSA). These statistics were derived from the 1977 - 78 Annual Housing Survey conducted in 20 selected SMSA's. The source of 1970 data shown in the report is tabulations from the 1970 Census of Population and Housing, and 1974 data were derived from the 1974 Annual Housing Survey. The report provides statistics on general housing characteristics for 1977, 1975, and 1970 and on indicators of housing and neighborhood quality for owner - occupied and renter - occupied housing units, on financial characteristics, on recent mover households, and on financial characteristics cross - classified by indicators of housing and neighborhod quality for 1977. Additionally, housing characteristics are given for black and Spanish heads of households. Statistics also illustrate the changes that have occurred in the housing stock of this SMSA from 1974 to 1977. For example, a net gain of 69,200 housing units has been recorded since 1974, with about 10 percent of the total housing stock constructed since the 1974 survey. Appendices describe the geographic area classifications and provide definitions and explanations of the subjects covered in the report, as well as information on sample design, estimation, and accuracy of the data. Table finding guides and area maps are also included. (Author abstract modified).

Annual Housing Survey: 1977. Housing Characteristics for Selected Metropolitan Areas: Dallas, Tex., Standard Metropolitan Statistical Area.
Aug 80, 546p HUD-0002103
Paper copy available from Supt. of Docs., Washington, DC 20402, order number 003-024-02097-1.

This report presents statistics on housing and household characteristics in the Dallas, Tex., Standard Metropolitan Statistical Area (SMSA). These statistics were derived from the 1977 - 1978 Annual Housing Survey conducted in 20 selected SMSA's. The source of 1970 data shown in the report is tabulations from the 1970 Census of Population and Housing, and 1974 data were derived from the 1974 Annual Housing Survey. The report provides statistics on general housing characteristics for 1977, 1974, and 1970 and on indicators of housing and neighborhood quality for owner - occupied and renter - occupied housing units, on financial characteristics, on recent mover households, and on financial characteristics cross - classified by indicators of housing and neighborhod quality for 1977. Additionally, housing characteristics are given for black and Spanish heads of households. Statistics also illustrate the changes that have occurred in the housing stock of this SMSA from 1974 to 1977. For example, a net gain of 42,200 housing units has been recorded since 1974, with about 6 percent of the total housing stock constructed since the 1974 survey. Appendices describe the geographic area classifications and provide definitions and explanations of the subjects covered in the report, as well as information on sample design, estimation, and accuracy of the data. Table finding guides and area maps are also included. (Author abstract modified).

Annual Housing Survey: 1978. United States and Regions. Part A: General Housing Characteristics.
Nov 80, 291p HUD-0002105
Paper copy available from Supt. of Docs., Washington, DC 20402, order number 003-024-02673-2.

This report presents statistics on general housing characteristics from the 1978 Annual Housing Survey for the United States. Data are presented for areas inside and outside the Standard Metropolitan Statistical Areas (SMSA's) and for each of the four geographic regions. The statistics are based on information from a sample of housing units. The information was collected by personal interviews from October 1978 to January 1979. The report provides data on general housing characteristics, indicators of housing and

neighborhood quality cross - classified by financial recent mover households, urban and rural housing characteristics, and energy - related housing characteristics. A large portion of the subjects covered in this report are the same as those collected in the 1970 Census of Housing; in general, these data are comparable to those shown in the 1970 Census reports. In addition, new subjects are introduced, including distance and travel time from home to work for the household head, storm windows and doors, insulation, breakdowns or failures in equipment, the physical condition of the structure, and the neighborhood conditions and services. Detailed statistics are also presented for mobile homes and trailers. Maps, a list of tables by regions, and a table - finding guide are included. Two appendices list area classifications and definitions and explanations of subject characteristics and of sources and reliability of the estimates. (Author abstract modified).

Annual Housing Survey: 1978. United States and Regions. Part C: Financial Characteristics of the Housing Inventory.
Aug 80, 326p HUD-0002106

This report presents statistics on financial characteristics of the housing inventory from the 1978 Annual Housing Survey for the United States by inside and outside standard metropolitan statistical areas (SMSA's) and each of the four geographic regions. Data are shown on income, value, and gross rent cross - tabulated by housing and household characteristics. Data were collected for approximately 78,000 sample housing units located in the counties and independent cities composing the 461 sample areas used in current surveys of the Census Bureau. Interviewers made personal visits to each sample unit and obtained the information from the occupants or if the unit was vacant, from other informed persons. The survey began in October 1978 and extended through January 1979. A series of standard tables present data showing characteristics for owner - occupied and renter - occupied housing units by income of the family or primary individual; characteristics for owner - occupied, 1 - unit structures by value of property; and characteristics for renter - occupied housing units by gross rent. The same information is also presented for housing units with black household heads and for housing units with household head of Spanish origin. In addition, Appendix A describes the geographic area classifications and Appendix B presents the information on sample design, estimation, and accuracy of the data. (Author abstract modified).

Codebook for the Household Survey, Site I, Wave 3. Housing Assistance Supply Experiment,
Patricia Boren. Nov 79, 1009p RAND/N-1309-HUD, HUD-0002107
Contract HUD-H-1789

This codebook is one of a series documenting survey materials used in the Housing Assistance Supply Experiment (HASE), which monitors the effects of experimental housing allowance programs operating in two midwestern housing markets by regularly surveying a marketwide sample of about 2,000 residential properties. The owners and occupants of those properties are interviewed annually; the observable characteristics of residential buildings and their environs are recorded at less frequent intervals. The codebook describes the data collected in the third ("wave 3") household survey (officially called the survey of tenants and homeowners) conducted in Brown County, Wis., Site I of the experiment. The survey was administered from January through July 1976 by the National Opinion Research Center (NORC), the survey subcontractor. For each question in the survey instrument, the codebook reproduces the exact word text, specifies all permissible responses, and provides a tabulation of the unweighted responses recorded in the "preliminary master file" of survey records. Where applicable, individual questions are annotated with instructions to the survey staff that affect the interpretation of responses. Four appendices contain charts of Brown couunty neighborhoods, final status category codes, a glossary, and audit codes. (Author abstract modified).

Developer Supply, Investor Demand, and Multifamily Housing Production: A Pilot Study,
C. Duncan MacRae, Margery Austin Turner, and Gary Anderson. Jun 81, 124p HUD-0002109
Contract HUD-H-2162R

This report describes the implementation of a model that simulates the effects of the Federal income tax on the production of subsidized multifamily housing. The project consisted of data collection, computer programming, sensitivity analysis, and tax policy analysis. The report presents complete calibration, policy, and sensitivity results for a large survey of FHA - insured and State - housing - financed and development - agency - financed Section 8 projects from the Chicago region. The model processes data on actual Section 8 projects to derive (1) a distribution describing a universe of potential projects from which builder - developers select projects to produce and (2) a probability function describing builder - developers' willingness to undertake potential projects. The effects of policy alternatives on subsidized multifamily production were projected by first estimating the effect of a change on the distribution of potential projects and then applying the probability function to determine how many potential projects are actually produced. Results obtained for the 312 FHA - insured projects and 305 State housing finance agency projects indicate that the model does a reasonable job of explaining the observed distribution of projects undertaken. Simulation of three tax policy alternatives showed that substituting a straight - line depreciation schedule for the accelerated sum - of - the - years' - digits method reduces production by over three - quarters. The second alternative -- diminishing depreciation deductions by increasing the useful lives of all depreciable components -- caused subsidized multifamily housing production to decrease by about one - half. The third alternative, substituting a taxable cash subsidy of 14 percent of replacement cost for the tax benefits, left FHA - subsidized multifamily housing production relatively unaffected, while only a 12 - percent grant was necessary to maintain State housing finance agency production. Tabular data are provided. (Author abstract modified).

Audit of the Survey of Residential Buildings, Site I, Wave 3. Housing Assistance Supply Experiment,
Sandra S. Figge. May 81, 41p RAND/N-1406-HUD, HUD-0002112
Contract HUD-H-1789

Results are reported from an assessment of the completeness of the data collected in the third (wave 3) survey of residential buildings in Site I (Brown County, Wis.) of the Housing Assistance Supply Experiment. The audit findings serve both to warn users of any significant defects in survey coverage and to check the effectiveness of field procedures. The audit involved verifying the composition of the wave 3 sample and determining whether an observation was completed for every sample building (and if not, why), along with examining the survey data for subtle errors not detectable in "cleaning checks." To avoid gathering data expected to be largely redundant, the wave 3 survey was addressed to a much smaller sample than in previous waves. The sample list contained 139 buildings -- 11 newly built on properties in the longitudinal sample, 69 in a sample of newly developed residential properties, and 59 in a sample of properties containing federally subsidized housing. Observations were completed for 107 buildings, 77 percent of the sample. Auditors subjected the survey data (already cleaned of clearly incorrect and implausible responses) to various checks for subtle errors. Each error report was investigated and the relevant response was confirmed without change, corrected, or replaced with a code explaining the absence of usable data. Footnotes, a glossary, and four tables are included. Supplementary tables are appended. (Author abstract modified).

Audit of the Survey of Residential Buildings, Site I, Wave 2. Housing Assistance Supply Experiment,
Beverly F. Lowe. May 81, 94p RAND/N-1404-HUD, HUD-0002113
Contract HUD-H-1789

Results are reported from an assessment of the completeness and reliability of the data collected in the second (wave 2) survey of residential buildings in Site I (Brown County, Wis.) of the Housing Assistance Supply Experiment. The audit involved determining the wave 2 status of every building that was in the sample at baseline or was added later; assessing the quality of the survey data from the perspective of reliability, aptness, and completeness; and appraising the potential for bias due to survey nonresponse and devising weights for analytically adequate records so that they collectively represent the population of residential buildings in the county. In accounting for the sample, the discovery of sampling errors and property configuration changes necessitated the deletion of 15 buildings from the sample of 92 added to the survey schedule during the wave 2 field period, thus giving a total sample of 2,225 buildings, based upon the baseline sample. Fifty - two buildings were subsequently retired from the survey due to ineligibility. A sample completion rate of 93.3 percent was finally achieved. In checking on data quality, the audit validated 22 percent of all attempted observations by readministering a set of questions from the survey instrument. Because the validation results cast doubt on the general quality of the data, it was necessary to repeat all observations originally assigned to the observers whose work was most called in question. In the area of testing and compensating for bias, the strata and variables showing uncompensated biases are reported, leaving it to users to make adjustments appropriate to their analyses. Footnotes, a glossary, and 20 tables are given. Supplementary data are appended. (Author abstract modified).

Specialized Courts: Housing Justice in the United States. Executive Summary,
Randall W. Scott. Mar 81, 148p HUD-0002136
Contract HUD-H-2856
Sponsored in part by Fire Administration, Washington, DC.

This document summarizes a study of the nature and effectiveness of specialized courts established by several cities to deal with housing disputes, especially those involving landlord - tenant issues and code enforcement problems. The summary is intended to assist evaluations of local court systems as they relate both to code enforcement and to housing matters generally. Of paramount concern is the proper and fair administration of justice through local court systems in the handling of housing disputes. Thirteen cities were studied because they had installed such specialized courts. Analysis of these courts indicates that they may be able to improve the delivery of housing justice at the local level. Among the types of specialized courts examined were code courts, landlord and tenant courts, special small claims courts, quasi - comprehensive housing courts, and comprehensive housing courts. The report discusses the types of housing disputes that go to court, the existing weaknesses in most available forums for dispute resolution, and the features of specialized housing courts that may alleviate inequities. Organizational, staffing, and administrative aspects of the court system are discussed, with emphasis on caseloads management, judges and quasi - judicial officers, and operations of the clerk's office. Considerations involved in designing a housing court are discussed, including staffing requirements and the particular functions of the housing specialist's component, mechanisms for community participation, budgetary and cost implications, and location and physical facilities for the housing court. Procedural and substantive law problems encountered in the experience of existing specialized housing courts are delineated. Footnotes are provided and reference is made to eight publications of the American Bar Association's Special Committee on Housing and Urban Development Law.

Housing Allowance Demand Experiment: Final Report,
Stephen D. Kennedy. Jun 80, 317p AAI-80/61, HUD-0002137
Contract HUD-H-2040R

This report summarizes the results of the Housing Allowance Demand Experiment. Several programs were operated in Pittsburgh, Pa., and Phoenix, Ariz., from 1973 to 1976 involving about 2,400 experimental households and 1,000 control households. The two major types of allowance plans tested were the Housing Gap plans, which offered to pay eligible households the difference between the average local cost of

modest standard housing and some fraction of household income if they found housing that met program housing requirements, and the Percent of Rent plans, which paid some fraction of a household's rent. The experiment, which included an unconstrained income transfer program and a control group, collected information on other housing programs, including Public Housing, Section 23, and Section 236. The report describes the various housing goals used to evaluate the programs and presents evidence that the incidence of physically inadequate and overcrowded housing among low - income renters is far higher than current national data would indicate. A comparison of Housing Gap allowances with other housing programs shows that Housing Gap allowances can be used to provide comparable housing under at most the same and sometimes less economically and racially segregated conditions with at least equal and sometimes greater tenant satisfaction. In addition, the report discusses the effects of allowance programs on recipient housing and compares them to similar programs of unrestricted transfers. The final chapter reviews findings and areas for future research. Tables, figures, footnotes, and six references are supplied. A description of the Demand Experiment, an annotated bibliography, a supplemental reference list, and tabular data are appended. (Author abstract modified).

Staphylococcus Aureus Protease: A Probe of Exposed, Non-Basic Histone Sequences in Nucleosomes.
R. L. Rill, and D. K. Oosterhof. 1980, 27p DOE/EV/05888-T2
Contract AS05-78EV05888

The digestion of histones in chicken erythrocyte nucleosome cores and chromatin by Staphylococcus aureus protease was examined. This protease cleaves specifically at acidic residues and prefers glu-X bonds under the conditions used. Only 1 of 24 glutamic and 2 of 13 aspartic acids among all four core histones are located in basic, amino-terminal tails, hence staph. protease is a highly specific probe of exposed nonbasic sequences. Staph. protease readily degraded H1, H5, and H3; moderately degraded H2b, and only slightly degraded H2a and H4 in nucleosomes and nucleosome cores. Electrophoresis of core histone fragments from limited digests showed that most glutamic acids were inaccessible, but at least five sites in nonbasic sequences were readily cleaved. Tentative assignments of these fragments based on comparisons with products from limited digests of pure histones suggested that most accessible sites in nucleosome cores occur in H3. The most probable sites of H3 cutting are glutamic acids at positions 51, 60, 73, 94, and 97. At least one site in H2b, probably the equivalent of glu-105 in the calf H2b sequence, was accessible. No sites in H2a and H4 appeared highly accessible. H5 was readily cleaved at a site near the amino-terminus. These data substantiate the other evidence that nonbasic core histone sequences are located primarily in the nucleosome interior, but that H3 binds to the ends of core DNA and thereby is partly exposed as the upper and lower surfaces of the disk-shaped core. Regulation of Nucleic Acid and Protein Synthesis: A Background Study Related to the Biological Effects of Radiation. Final Report on Research Activities.
1979, 5p DOE/EV/02403-T1
Contract AS02-76EV02403

The existence of an intricate interplay of nucleic acids and nucleotides in the chain of events leading from free amino acid to completed polypeptide chain has been determined. To this was added another participant to the nucleotides in protein synthesis - diadenosine-5', 5''', p'p exp 4 -tetraphosphate (Ap4A). Ap sub 4 A serves as an initiation primer for DNA synthesis in a eukaryotic system catalyzed by DNA polymerase alpha . Thus the initial step in protein synthesis is linked to the first step in DNA synthesis by a small molecular weight, unique dinucleotide signal. Advances in the methodology of nucleic acid sequencing have made it possible to examine the relationship between specific short segments of DNA and RNA and their function in the metabolism of the living cell. The triester method of synthesizing deoxynucleotide polymers has made it feasible to synthesize and use specific oligomeric deoxynucleotide sequences as probes of genetic function and potential viral inhibitors. The synthesis of ribonucleotide polymers has been more difficult, due almost entirely to the presence of the 2' ribosyl hydroxyl group. The possibility is now emerging, however, of employing ribonucleotide polymers as specific RNA-virus inhibitors. (ERA citation 06:035477)

Heterogeneity and Expression of the Zein Storage Protein Gene Family of Maize.
F. Burr, and B. Burr. 1981, 13p BNL-30027, BIO-3764, CONF--8104110--1
Contract AC02-76CH00016
Stadler genetics symposium, Columbia, MO, USA, 10 Apr 1981.

The storage protein zein is synthesized by polysomes on the endoplasmic reticulum in certain cells of the maize seed. As zein accumulates within the membrane lumen the cisternae are transformed into vesiculate protein bodies. Zein is comprised of a large family of structurally related polypeptides that fall into two classes of 19,000 and 22,500 daltons. On two dimensional IEF:SDS polyacrylamide gels, the number and positions of the electromorphs within each class differ greatly from one strain to another. Typically, however, there may be 8 to 12 spots for each class. Within any strain that has been examined the polypeptides consti-

tuting each molecular weight class have a similar amino-terminal sequence, but there are a number of position differences when the sequences are compared between strains. An in vitro system using maize endosperm membranes has been developed to study the synthesis and processing of maize preproteins. Assessment of the products made indicates that the method faithfully recapitulates the in vivo processes. Cloned cDNA zein sequences were employed to examine the extent of genetic heterogeneity. Based on restriction analyses and dot hydridizations, eighteen zein clones could be divided into three classes for the light zein class and two for the heavy zein class. The Southern transfer hydridizations showed a very complex picture that suggests that zein is encoded by many genomic sequences which share partial homologies. Many more sequences are recognized than there are polypeptides. Possibly some of these represent relic sequences and pseudogenes but until more is known about the structures of the different zein genes, an estimate of the number of copies in the maize genome by hydridization with cloned sequences cannot be made. (ERA citation 06:035485)

Impact of Energy-Related Pollutants on Chromosome Structure. Progress Report, January 1, 1981-December 31, 1981.
R. L. Rill. 1981, 11p DOE/EV/05888-4
Contract AS05-78EV05888

Products of reactions of deoxyribonucleosides with diethylsulfate and ethyl methanesulfonate in neutral aqueous solution and in DMSO, and with ethyl iodide in DMSO, were separated and quantitated by reverse phase PHLC. Aqueous reactions yielded small, but significant, amounts of nucleosides modified at exocyclic positions. Several unidentified derivatives not previously reported were found. A method for resolving all known ethylated deoxyribonucleotides was developed. The covalent coupling of ethidium monoazide to DNA alone and DNA in chromatin was examined. Covalently bound ethidium preferentially bound to DNA recovered in subnucleosomes. The amount of covalently bound ethidium recovered in mononucleosomes decreased with increasing nuclease digestion, suggesting that nucleosomes most susceptible to nuclease attack preferentially bind ethidium. Covalently bound ethidium weakens the glycosidic bond so that the DNA chain can be cleaved specifically at ethidium-bound sites. This will permit precise definition of ethidium binding sites in nucleosomes. High field, natural abundance carbon-13 NMR spectra and NOE data were obtained for nucleosome core length DNA complexed with various concentrations of mercury. Mercury binding caused no significant changes in resonance linewidths or NOE's. This suggests that mercury ions primarily form interstrand crosslinks between base pairs without affecting the chain motional dynamics. (ERA citation 06:035518)

Size and Sex Ratio of King Mackerel, 'Scomberomorus cavalla', in the Southeastern United States.
Technical memo.,
Lee Trent, Roy O. Williams, Ronald G. Taylor, Carl H. Salmon, and Charles S. Manooch, III. Apr 81, 63p NMFS-SEFC-62, NOAA-81073102

Data from over 54,000 king mackerel, Scomberomorus cavalla, were analyzed to evaluate temporal variations in size and sex composition in seven areas of the southeastern United States. Data were obtained from recreational hook-and-line fishermen of the coastal states from Texas to North Carolina, and from commercial hook-and-line and gill-net fishermen of south Florida. Most of the length-frequency distributions derived from king mackerel catches were unimodal. This distribution is typical of a species that spawns over a long period each year, has highly variable growth rates among individuals, or both. Size composition in each area varied considerably between months and indicated temporally heterogeneous groups of king mackerel. Females were dominant in the catches in all areas and years except south Florida in 1978. Annual or ranges of annual estimates of percentage female by area were: Texas, 60.8 to 62.2%; Louisiana 91.9 to 92.2%; northwest Florida, 57.1 to 75.1%; south Florida, 40.2 to 75.4%; and North Carolina, 75.8%. No explanation for these deviations from a 1:1 sex ratio was attempted. District seasonal changes in sex ratio were observed only in Texas.

Report of an Amphipod Species New to Ohio: 'Gammarus minus' Say (Amphipoda: Gammaridae).
Journal article,
David C. Beckett, Philip A. Lewis, and John R. Holsinger. 24 Mar 77, 4p EPA-600/J-77-183
Pub. in Ohio Jnl. of Science 77(4), p242 Sep 77. Prepared in cooperation with Old Dominion Univ., Norfolk, VA.

Gammarus minus is reported from two locations in Southern Ohio. This is the first record of the species from Ohio, although it is very common from other limestone areas of the midwest.

A New Species of 'Stenonema' (Ephemeroptera: Heptageniidae) from Eastern North America.
Journal article,
Frank Louis Carle, and Philip A. Lewis. 16 Aug 77, 6p EPA-600/J-78-189
Pub. in Annals of the Entomological Society of America, v71 n3 p285-288, 15 May 78.

Adults and nymphs of Stenonema meririvulanum sp. are described. Adults are characterized by large dark spiracular dots, gray margined hind wings, and very long banded caudal filaments. Nymphs are characterized by 'V'-shaped pale areas on abdominal terga 7-9, posterolateral spines on abdominal segments 7-9, and an unmarked abdominal venter. The species has been collected from small prisine streams in the Appalachian Mountains.

Susquehanna River Anadromous Fish Studies, Conowingo Dam to Havre De Grace, Maryland.
Final rept.,
Harold J. Petrimoulx, Peter N. Klose, C. Braxton Dew, and George T. Potera. Dec 80, 67p PPSP/UBLS-80-5
See also PB82-135971. Prepared in cooperation with Lawler, Matusky, and Skelly Engineer, Inc., Pearl River, New York.

The abundance and life history of the four Alosa spp. spawning in the lower Susquehanna River, Maryland, were studied during the Spring of 1980. The present study was initiated to provide additional information needed to assess quantitatively the status of the anadromous fishery and to investigate possible effects of the discharge schedule of the Conowingo Dam on Alosa spp. migration patterns in the lower river.

Intensive Culture of Walleye ('Stizostedion vitreum vitreum'),
R. G. Howey, G. L. Theis, and P. B. Haines. Sep 80, 15p LAMAR INFORMATION LEAFLET-80-05

An intensive rearing program was initiated at Lamar Fish Cultural Development Center in an attempt to eliminate some of the unreliability in the pond culture of walleye. Miniaturized salmonid-type indoor facilities were used to rear the fish. The fry were started on Artemia and subsequently converted to a formulated dry diet at 1.5 cm with just under 30% survival. At present, a larger live-food organism, such as Daphnia, appears to be an intermediate requirement by the walleye before they can be converted to the formulated dry diet.

Investigation of Hydrodynamic and Behavioral Factors That Affect Zooplankton Sampling by Pumps.
Final rept.,
Fred Jacobs, Al Y. Kuo, and George C. Grant. Oct 81, 78p PPSP-MP-34
Prepared in cooperation with Virginia Inst. of Marine Science, Gloucester Point.

The present study used a recirculating hydraulic flume to examine the effects of ambient flow regimes, flow fields induced by sampling pumps, sampler orientation, and copepod behavior. The study evaluates the degree to which these factors and their interactions influence the accuracy of zooplankton density estimates. The methodology included a descriptive phase, which is a presentation of flow visualizations under a variety of ambient and pumping conditions. This was followed by quantitative experiments that tested the ability of pump samplers to obtain accurate density estimates of passive particles. Results of this study provide a greater understanding of problems associated with zooplankton sampling in power plant cooling systems and in natural waters.

This report consists of an update of the data base and analysis of the potential impacts to commercial fishing of proposed Outer Continental Shelf oil and gas lease sales in the St. George Basin and North Aleutian Shelf, situated in the Bering Sea off Alaska. Impacts on the Bristol Bay fishery are also discussed. Competition for labor between the fishing and oil industries is examined, as well as an analysis of risk of collision among vessels in the OCS areas. A description of the fisheries resources of the area is followed by an analysis of loss of access to fishing grounds, and loss of or damage to gear. Impacts on the recreational fishery are also discussed.

Feline Malignant Lymphoma: A Multiway Frequency Analysis of a Population Involving Sex, Age, Cell Type, and Tumor Location.
Master's thesis,
Michael V. Slayter. Jul 79, 31p Rept no. AFIT-CI-79-300T-S

A multidimensional descriptive study of feline malignant lymphoma was performed using age, sex, cell type, and tumor location of 1,733 cases. The interactions between these four variables were determined and interpreted. Particular consideration was given to the relationships of age to tumor location, age to sex, and tumor location to cell type. These three interactions were shown to be the major interactions in the study. The use of computer analysis of the multiway frequency table was discussed. Suggestions were offered that future lymphoma studies utilize the multiway frequency table with different variables. (Author)

Medicare's Reimbursement Policies for Durable Medical Equipment Should be Modified and Made More Consistent.
10 Sep 81, 42p Rept no. GAO/HRD-81-140
Report to the Honorable Russell B. Long, United States Senate.

This review was requested by the former Chairman of the Subcommittee on Health, Senate Committee on Finance, to evaluate allegations to the effect that suppliers of durable medical equipment to Medicare beneficiaries in certain southeastern States were being subjected to discriminatory reimbursement and coverage requirements. Medicare payments for durable medical equipment--hospital beds, wheelchairs, commodes, and oxygen equipment--are estimated in excess of $125 million a year. Durable medical equipment for use in a beneficiary's home is covered under Medicare if it is medically necessary. Medicare payments for such items are made by contract paying agents called carriers. For two items of equipment (standard hospital beds and wheelchairs), the payments may not exceed an amount based on the lowest charge level at which the items are 'widely and consistently available in a locality.' The Health Care Financing Administration (HCFA) has defined the lowest charge level as one high enough to include the cumulative 25th percentile in the distribution of actual charges submitted during a previous period. GAO was asked to review the payment levels for durable medical equipment in Georgia, Alabama, Florida, South Carolina, and selected other States. The other States were Connecticut, New Hampshire, Vermont, Missouri, and northern California. (Author)

Fathering and the Pediatric Cancer Experience.
Master's thesis,
Patricia Ann Damler. Dec 79, 93p Rept no. AFIT-CI-79-308T

A descriptive study was conducted to answer the question: What is the cultural knowledge that informs the behavior of fathers in interaction with their children during the pediatric cancer experience. The concepts of the culture of the father, the fathers' role in the family, and the crisis of the pediatric cancer experience formed the basis of the conceptual framework. Ethnographic interviews were conducted with four fathers of children being treated at a medical center in a large southwestern city. Tape recordings of the interviews were transcribed and analyzed between interviews. From analysis of the recordings, taxonomies were developed of which 'kinds of things fathers do with children' and 'kinds of things fathers do when they monitor the health of children' are examples. Five cultural themes identified: (1) being there, (2) education on a day to day basis, (3) recreation, (4) fear, and (5) quality of life. Fathers were found to be deeply involved and therefore their views need to be emphasized in the nursing care of children. (Author)

The Effects of Diet Calcium, Protein and Acidity on Calcium Retention in the Rat, Particularly as Related to the Inner and Outer Surfaces of Tubular Bone: A Possible Model for the Treatment or Prevention of Osteoporosis.
Doctoral thesis,
Joseph E. Milligan. Oct 79, 267p Rept no. AFIT-CI-79-304D-S

The effects of graded levels of diet calcium, protein and acidity on radiographic and gravimetric measurements, and on mineral composition of femurs were studied in Long Evans, young and old, female rats. With increased diet calcium, femur potassium percent in ash is decreased in both young and old rats. Otherwise, bone (as a tissue) is chemically unaffected by diet treatment. Increasing diet protein results in increased bone turnover at both bone surfaces, as well as increased cortical area and bone density in young rats. The effects of graded levels of diet calcium, protein and acidity on soft tissue calcification were also studied in female rats fed diets with varying magnesium levels which met National Research Council Requirements but which induced elevated kidney calcium levels as reported by some reseachers. Low magnesium diets in the young growing rat induced nephrocalcinosis which was shown by histopathologic examination to be an intracellular-initated dystrophic calcification.

Long and Short-Term Memory Processes in Cortically Damaged Patients.
Doctoral thesis,
Jordan Grafman. 1981, 173p Rept no. AFIT-CI-81-54D

The purpose of this study was to examine the contribution of the cerebral (non-limbic) cortex to specific verbal memory processes. Based on a literature review of psycholinguistic and memory processes in normals and central nervous system impaired patients, a tentative model of the brain regions subserving verbal memory processes was developed by the author. The model suggests that the left hemispheric cortex subserves both short term memory and lexical/conceptual storage, while the encoding or 'tagging' process that results in verbal information being transformed from a short term to long term state is dependent upon subcortical (limbic-thalamic) systems. To test the validity of this model, several hypotheses were developed. It was suggested that left cortically lesioned patients would have an inferior performance to controls and right cortically lesioned patients on recall, retrieval from long term storage, and long term storage measures on early trials of a Selective Reminding Test primarily due to a phonemic processing impairment. It was also suggested that only cortically lesioned patients (but not controls) would have poorer recall for low frequency relative to high frequency words. The results suggested that the left cortically lesioned group had a limited auditory-verbal memory deficit due to both linguistic (phonemic processing) and memorial (long term retrieval) factors. Their performance, however, was both qualitatively and quantitatively superior to Korsakoff patients who demonstrated severely impaired encoding and retrieval processes as a probable result of minimal contextual or episodic tagging of verbal stimuli.

Dental Emergencies Occurring among U.S. Army Recruits.
Rept. for Jan-Jun 80,
Pushpinder S. Grover, William M. Carpenter, and Gary W. Allen. 30 Sep 81, 10p

A study was undertaken to determine the incidence of dental emergencies among 5,000 U.S. Army recruits during basic field training. A total of 1,294 recruits reported for dental sick call over a period of 6 months. The most frequently occurring conditions causing emergency vists were found to be caries, periapical abscesses, postoperative complications, pericoronitis, defective restorations, gingivitis, traumatic injuries, and mucosal ulcers. (Author)

Predictability of Dental Emergencies by Panography.
Rept. for Jan-Jun 80,
Pushpinder S. Grover, William M. Carpenter, and Gary W. Allen. 30 Sep 81, 14p

A study was undertaken to evaluate the effectiveness and reliability of panoramic radiography for prediction of dental emergencies. Five thousand panographs were reviewed, and 732 potential dental emergency situations (PDES) were identified. Over a 6-month period, 248 of the recruits identified as PDES actually reported for dental sick call. This constituted 19 percent of the total sick call. It is believed that by proper interpretation of panographs and by making provisions for interceptive dental care, at least 19 percent of the total sick call could be eliminated. (Author)

An Assessment of the Dental Needs of Army Recruits.
Final rept.,
Warren A. Parker, David G. Brunner, and A. David Mangelsdorff. Jul 81, 41p Rept no. HCSD-81-004

Current information about the dental care needs of Regular Army recruits is not routinely available to the Department of the Army Assistant Surgeon General for Dental Services for use in determining the allocation of limited dental resources. Similar information about the Reserve and National Guard components is also sorely lacking to mobilization planners. The purpose of this study was to determine the dental treatment needs of Army recruits by component, sex, ethnic background, and level of education. A random selection of incoming recruits was examined by experienced dental officers, and treatment plans were developed. The resulting data was analyzed to determine the needs per thousand recruits for 15 care variables. Treatment times were also established to provide the required care. In general the dental care needs of current all-volunteer forces are approximately the same as when the draft was in effect although shifts have occurred in the relative magnitude among the care variables. Restorations account for 41% of total care needs of recruits. Significant differences were shown among the needs for Army components. Level of education and ethnic background are important variables in determining recruit population dental needs. It is recommended that the report be made available to dental resource utilization and mobilization planners and that a dental classification system that identifies severity of care needed be developed and implemented.

Teleradiology.
Final rept.,
James J. James, A. David Mangelsdorff, and Warren A. Parker. May 81, 39p Rept no. HCSD-81-003

Radiographic studies representative of the spectrum of trauma cases that might be present in an emergency room were selected from actual cases presented to the emergency room at Brooke Army Medical Center (BAMC) in San Antonio, Texas. The studies were then transmitted from a local television studio via satellite back to BAMC and three other Army Hospitals on two

separate occasions. The transmitted images were viewed on commercial grade television sets by panels of physicians (radiologists and other specialties) at the receiving hospitals. The panel members were asked to give their diagnostic impressions regarding the specific cases and to comment on the applicability and usefulness of teleradiology. Overall, it was found that an image of diagnostic quality could be transmitted for most, but not all radiographic cases and that the participating physicians felt this approach had great potential for the practice of radiology both in field and fixed AMEDD facilities.

Conference rept.,
Michael Stek, Jr. 9 Sep 81, 8p Rept no. ONRL-C-4-81

The epidemiological conference discussed here was attended by some 900 participants from more than 60 countries. The program covered a wide range of topics related to the epidemiology and prevention of acute and chronic diseases. In this report, the author directs his attention to the discussions about tropical and infectious diseases, which are his areas of special interest.

Evaluation of the Effectiveness and Efficiency of Preventive Dentistry Programs: Assessment of the Relationship between Past Dental Experience and Dental Sick Call in the Field.
Final rept. 1 Oct 80-30 Sep 81,
Warren A. Parker, John E. King, and David G. Brunner. Sep 81, 33p Rept no. 81-013

The relationship between dental sick call during Army field training exercises and prior dental experience of Army personnel was examined by analyzing data on 92 soldiers who reported to field support dental facilities for emergency conditions and data on 97 randomly selected soldiers who participated in the same exercises but did not report for dental emergencies in the field. Approximately 7745 Troops from different units participated over a time period of 117 days in 3 separate field exercises. The findings indicate an annual dental sick call rate of 234 per 1,000 soldiers. Caries was the most frequent cause of the emergencies (41.2%) followed by third molar/pericoronitis (15.9%), defective filling or fractured tooth (11.0%), gingival and peridontal problems (9.3%), and trauma (2.7%). The most frequent primary treatment rendered in the exercises was extraction (20.9% of primary treatment). When considering all treatment, perscription of medications was the most frequent (35.4%). Eighty-four percent (84%) of the patients were returned to duty without further evacuation. The finding most pertinent to the purpose of this study was that significantly more of the control group had completed the requirements of their last Army Oral Health Maintenance Program (AOHMP). That is, they were given a dental examination during their last birthmonth. The sick call group completed AOHMP requirements in 29.2% of the cases compared to 45.4% for the control.

Little (Arthur D.), Inc., Cambridge, MA. Dept. of Experimental Hematology.
Kinetics of Neutrophil-Releasing Activity of Post-Leukapheresis Plasma.
Final rept. 1 Feb 76-31 Jan 81,
Albert J. Roy. 1 Nov 81, 62p
Contract N00014-76-C-0489

Humoral factors are elaborated by animal and human granulocyte donors during filtration leukapheresis. Plasma obtained from leukapheresed rats (PPP) may be used to increase granulocyte yields in donors when given prior to leukapheresis. This effect is dose and time related. The titer of neutrophil releasing activity is related to the duration of pheresis. There is positive correlation between the donor pre- and postgranulocyte count and the titer of neutrophil releasing activity of the PPP. This activity in PPP is stable for up to three weeks at 4 C. The maximum granulocyte increment observed following injection of PPP occurs at three hours after injection. Intraperitoneal injection of PPP is ineffective.

Health Planning Reports: Abstracts. Volume 1, A-1 through A-7970.
Aug 81, 1149p
See also Volume 2, HRP-0903307.

The Health Planning Reports Abstracts are a compendium of citations and abstracts in the National Health Planning Information Center's (NHPIC) collection of health planning literature and government reports and studies. These volumes are intended for use by health planning agencies to facilitate access to all health planning documents announced by NHPIC. The abstracts are companion documents to the health planning reports indexes which have been printed and distributed by NHPIC. The indexes include the Health Planning Reports Subject Index, the Health Planning Reports Personal Author Index, the Health Planning Reports Corporate Author Index, and the Health Planning Reports Title Index.

Health Planning Reports: Abstracts. Volume 2, A-7971 through A-16333.
Aug 81, 1148p
See also Volume 1, HRP-0903306.

The abstracts are arranged numerically by abstract number. Each citation includes (1) personal author and/or corporate author; (2) title; (3) publication date; (4) number of pages; (5) availability statement; (6) identification number expressed as an eleven digit alpha-numeric code, i.e., HRP-0000111; and (7) a NHPIC abstract number, i.e., A100. To locate a specific health planning document first refer to the title and author indexes or refer to the subject index if you want to locate a specific planning subject or topic.

This volume is a component part of the third edition of the State and Local Report Series Employment, Mobility and Personal Characteristics of Newly Licensed Nurses. The data summaries for this edition (1979) were prepared by the National League for Nursing (NLN), under contract with the Health Resources Administration, from data collected by the National League for Nursing in their annual surveys of newly licensed nurses. The first two editions (1977 and 1978) are available from the NLN. The series consist of 50 volumes, with some volumes having up to 5 parts. Volume 1 (The State Summaries) provides national summary information by State, for all variables, and Volumes 2-50 (individual State reports) provides the same information for Health Service Area's (HSA's) and counties within the HSAs of the State. These reports contain timely, up-to-date and relevant statistical information of interest to questions on the supply, demand, and distribution of nurses. The data will be helpful to those persons responsible for planning, recruiting, or research in the area of health manpower, particularly in monitoring the dynamics of nursing manpower.

This volume is a component part of the third edition of the State and Local Report Series Employment, Mobility and Personal Characteristics of Newly Licensed Nurses. The data summaries for this edition (1979) were prepared by the National League for Nursing (NLN), under contract with the Health Resources Administration, from data collected by the National League for Nursing in their annual surveys of newly licensed nurses. The first two editions (1977 and 1978) are available from the NLN. The series consist of 50 volumes, with some volumes having up to 5 parts. Volume 1 (The State Summaries) provides national summary information by State, for all variables, and Volumes 2-50 (individual State reports) provides the same information for Health Service Area's (HSA's) and counties within the HSAs of the State. These reports contain timely, up-to-date and relevant statistical information of interest to questions on the supply, demand, and distribution of nurses. The data will be helpful to those persons responsible for planning, recruiting, or research in the area of health manpower, particularly in monitoring the dynamics of nursing manpower.

Maryland Statewide Health Coordinating Council, Baltimore.
Determination of System Needs, and Associated Data Needs, SHCC Guidelines for Fourth HSPs (Section IX).
Sep 81, 31p

Each Health Systems Agency (HSA) in its Health Systems Plan (HSP) is required to establish projected needs for health care resources. Methodologies are selected or developed for each of these need determinations. The methodologies are mathematical formula that use available information about past and present need or usage as related to future need or usage. Methodologies agreed upon in Maryland for the follow-

ing specific service settings are presented: acute inpatient bed needs (obstetric, pediatric, medical/surgical/gynecological/addictions); longterm care bed needs (nursing homes); alcoholism intermediate care bed needs; megavoltage radiation therapy machine needs; and primary care physician needs. In terms of the analyses and need determinations resulting from the application of the methodologies to these service settings, it should now be feasible to prepare a State Health Plan made up of truly coordinated HSPs. The methodologies deal primarily with availability of service resources, which is only one of the health system characteristics. These statewide methodologies, with the resulting net need determinations and associated resource requirements and recommended actions, shall apply throughout Maryland.

Rensselaer Polytechnic Inst., Troy, NY. School of Management.
Economic Impact and Project Selection Methodology for Certificate of Need.
Midterm rept.
Sep 79, 174p
Sponsored in part by New York State Health Planning Commission, New York.

The results of the first half of the Rensselaer Polytechnic Institute study of the Certificate of Need (CON) process in New York State are presented. The objective was to address the integration of the CON process and the health planning process in the context of the limited resources available to spend on health care. The primary thrust of the project is to estimate both capital and operating expenditures for CON projects and to develop methodologies to utilize these economic factors in combination with regional/state health plans to aid in the selection of approved CON projects. This report includes background information on the CON process; analysis and the results of the development of the Project Classification System (PCS); a description of the methodology and data to be used in calculating the estimates for the economic impact measures (EIMs) which, for the purposes of this study, include the concepts of capital cost, annual operating cost, and souce of revenues; the approach taken in the selection of the health impact measures (HIMs); and the Health Systems Agency review process. A model will be developed and tested.

HRP-0903737/5 PC **A02**/MF **A01**
Merrimack Valley Health Planning Council, Inc., Lawrence, MA.
The Health Systems Agency Role in Building Primary Care Systems at the Local Level: A Recent Example,
Robert C. Starratt. Nov 80, 18p
Sponsored in part by Bureau of Health Planning, Hyattsville, MD.

The task of the Health Systems Agency (HSA) in working with consumers and providers of primary care in the Greater Lawrence, Massachusetts area to develop the Greater Lawrence Family Health Center (FHC) is recounted in detail. In this discussion of HSA involvement, attention is directed to the HSA interaction with a local hospital; involvement with a consortium of local consumers and providers; and the HSA role as mediator and advisor, facilitator, and consultant. The HSA representative was involved in researching and presenting several different models for discussion and modification. The model finally proposed, although simplistic, proved sufficient to support the potential feasibility of locating a National Health Service Corps (NHSC) site in the Lawrence-Methuen area. The model was generally considered to be favorable by most involved parties, with the exception of area physicians, many of whom objected to the area hospitals' increasing their involvement in the delivery of primary care. The site, officially known as the Greater Lawrence FHC, was opened with a staff consisting of a bilingual (English-Spanish) NHSC family physician, a bilingual nurse's aid, one bilingual clerk typist, one bilingual clerk receptionist, and a half-time administrative coordinator. Problems encountered by the FHC and the assistance provided by the HSA are reviewed.

Merrimack Valley Health Planning Council, Inc., Lawrence, MA.
Analysis of Nursing Manpower Shortages in Merrimack Valley Home Health Care Agencies, Part I: The Nature and Severity of the Shortage.
Oct 81, 20p
Sponsored in part by Bureau of Health Planning, Hyattsville, MD.

A survey of home health care agencies was conducted in February 1981 in the Merrimack Valley region in the Northeast corner of Massachusetts. The objective was to ascertain the nature and the severity of any nursing personnel shortage and to determine some of the factors contributing to these shortages. By April 1981, all 14 agencies had responded to the questionnaire. The following were among the survey findings: (1) 82 percent of all home health care agencies reported problems in filling vacant nurse positions and in meeting requests for nursing services; (2) except for filling home health aide (HHA) positions where the difficulty seems to be equal for both, temporary agencies demonstrated more severe problems than the visiting nurse agencies; (3) contracting did not appear to be a solution that any of the agencies needing to do so found attractive because of high costs, poor quality, and little control over employees; and (4) for the most part, the problems of filling positions appeared more severe for lesser-skilled personnel than for the high-skilled registered nurse and licensed practical nurse personnel. A copy of the questionnaire is included.

Population-Based Mental Health Needs Assessment Methodology for Use in HSA/SP.
Final rept.
Dec 79, 217p
Sponsored in part by Bureau of Health Planning, Hyattsville, MD. Prepared by A. T. Kearney, Inc.

The Health Systems Agency of Southeastern Pennsylvania (HSA/SP) contracted A. T. Kearney, Inc., to develop a population methodology for assessing gross need and unmet need in the area of mental health. This study report includes the following: an extensive literature search; an assessment of the current state-of-the-art methodologies with descriptions of their relative merits and disadvantages; a description of two local needs assessments now being conducted in the Southeastern Pennsylvania region and a detailed description of three needs assessment methodologies which are appropriate for HSA/SP. The mental health needs assessment methodology recommended for HSA/SP and described in detail involves the integration of several basic approaches: baseline data collection; social indicator approach; key informant approach; community forum approach; and community survey approach. The methodology is long-ranged, is expected to take three to five years to complete, and is a phase process.

Employment, Mobility, and Personal Characteristics of Nurses Newly Licensed in 1979: New Jersey, Volume 30.
Aug 81, 271p
Contract PHS-232-80-0050

This volume is a component part of the third edition of the State and Local Report Series Employment, Mobility and Personal Characteristics of Newly Licensed Nurses. The data summaries for this edition (1979) were prepared by the National League for Nursing (NLN), under contract with the Health Resources Administration, from data collected by the National League for Nursing in their annual surveys of newly licensed nurses. The first two editions (1977 and 1978) are available from the NLN. The series consist of 50 volumes, with some volumes having up to 5 parts. Volume 1 (The State Summaries) provides national summary information by State, for all variables, and Volumes 2-50 (individual State reports) provides the same information for Health Service Area's (HSA's) and counties within the HSAs of the State. These reports contain timely, up-to-date and relevant statistical information of interest to questions on the supply, demand, and distribution of nurses. The data will be helpful to those persons responsible for planning, recruiting, or research in the area of health manpower, particularly in monitoring the dynamics of nursing manpower.

Optimal Control of a Network of Whole Blood Banks: Target Inventory Levels for a Hospital Blood Bank or a Decentralized Regional Blood Banking System.
Final rept. 1 May 72-27 Sep 77,
Morris A. Cohen, and William P. Pierskalla. Mar 78, 42p NCHSR-81-179
Grants PHS-HS-00786, PHS-GK-40034
Prepared in cooperation with Pennsylvania Univ., Philadelphia.

In a recent paper by Brodheim, Hirsch and Prastacos (1976), curves relating recommended whole blood/red cell inventory levels and mean daily demand were developed for various specified shortage rates. This paper extends their analysis to establish a simple decision rule which yields the optimal inventory level for each blood type as a function of various factors in the blood bank environment. In using this rule it is not necessary for the blood bank administrator to choose a shortage rate for system operation since the inventory level recommended by the rule reflects the optimal trade-off between shortages and outdates. The elimination of the requirement to pick and justify a shortage rate exclusive of other system outcome measures greatly simplifies the administrator's decision problem. For any given inventory level it is possible to compute the anticipated shortage rate when operating at that level. In the cases studied, it is shown later in the paper that when using the inventory level obtained from the optimal decision rule, the 'implicit' shortage rate is near .001 for large volume blood types and .01 for rarer or small volume types. On the other hand, the outdate rate is shown, in general, to be quite sensitive to certain specific factors in the blood bank management and environment (age of supply, transfusion to crossmatch ratio, and the crossmatch release period). Depending on these factors, the rule yields outdate rates which vary from .001 to .07.

Fire Department Participation in the Identification and Transportation of Victims of Thermal Injury 'In Central New York State' Exploratory Study.
Final rept.,
William R. Clark, Jr., Bruce L. Riddle, and Dennis Lerner. 26 Feb 81, 50p
Contract EMW-02986

The objective of this study was to establish the role of the fire service in the identification and transportation of burn victims from the scene of fire department service to medical facilities. Burn injury data collected in Central New York State under the National Burn Care Demonstration (DHHS) and fire casualty and incident reports submitted by local fire departments through the New York State Office of Fire Prevention and Control to the U.S. Fire Administration along with locally gathered fire department records were compared. Rates of fire service participation in burn patient triage were compared with total burn incidence records in hospital records in the Central New York Region. It was found that the number of burn victims having some contact with the fire service was small in proportion to the total number of thermal burns occurring within the region.

Epidemiologic Study of Rocky Mountain Fever (RMSF).
Annual rept. 1 Jul 79-31 May 80,
Harvey R. Fischman, Charles L. Wisseman, Jr., and David L. Sorley. 9 Jun 80, 14p DAB-VDP-06-128
Contract N01-AI-9-2622

The first year of the project was concerned primarily with tooling up, preparing reagents and training new personnel. Reagents for serological procedures have been prepared. Dog sera has been obtained from nine veterinary clinics and tested for RMSF antibody. Dog ticks are being collected on a monthly basis for examination. An intensive surveillance is underway for human cases of RMSF. Selected physicians (350) from seven high incidence counties are being called on a biweekly basis to determine whether suspect cases of RMSF have been seen. Letters have been sent to all appropriate physicians, hospitals and emergency rooms in the seven counties informing them of the nature of the study and providing them with essential information that the authors hope will improve reporting.

United States-Japan Cooperative Cancer Research Program.
The United States-Japan Cooperative Cancer Research Program Progress Report, April 1980 through March 1981.
1981, 145p

This report summarizes activities of the U.S.-Japan Cooperative Cancer Research Program for the Japanese Fiscal Year 1980, the period between April 1, 1980 and March 31, 1981. Following the very successful conclusion of the first five-year period, the U.S.-Japan Cooperative Cancer Research Program entered into the second five-year period in April 1979, with substantial restructuring of the Program intended to provide greater flexibility in operation to meet the needs of the changing interests and new research areas emerging in the recent progress of cancer research. The most important modification has been consolidation of the previous eleven areas of cooperation into four major areas: (1) Etiology; (2) Biology and Diagnosis; (3) Treatment; and (4) Interdisciplinary Program and Coordination. The Interdisciplinary Program and Coordination Area is intended to serve the function of general coordination of the other three areas, consideration of new programs of scientific merit, facilitation of interdisciplinary programs (including those on organ sites), and sponsoring of interdisciplinary meetings.

A New Method for Determination of Anti-Double Strand DNA Antibodies, Trypanosoma Equiperdium Immunofluorescent Method,
Shizheng Xu, Huizhen Wang, and Hongjiong Li. Sep 81, 6p
Included in Chinese Medical Jnl., v94, n9 p549-566 1981.

A new method of determining anti-double strand DNA antibody by blood smears of mice infected with Trypanosoma equiperdum used as a substrate for immunofluorescent technic is described. Sera from 547 persons, including 62 patients with systemic lupus erythematosus (SLE), 66 with other connective tissue diseases (CTD), 288 with miscellaneous diseases, and 129 healthy medical workers and blood donors were determined. The results were all 20 patients with active SLE showed strongly positive reactions; only 4 of 42 patients with inactive SLE showed weakly positive reactions; all other CTD patients except 1 and all patients with miscellaneous diseases as well as healthy controls showed negative reactions. This test demonstrates very good correlation in comparison with the Farr assay and has some advantages over it, such as simplicity of performance, reliability and constancy of results and SLE specificity. Moreover, the method seems applicable to the detection of antinuclear antibody (ANA) under certain conditions. It is of value in diagnosis and follow up of SLE.

A New Concept on the Natural Course of Hepatocellular Carcinoma,
Zhaoyou Tang. 1981, 4p
Included in Chinese Medical Jnl., v94 n9 p585-588 1981.

Based upon mass screening of hepatocellular carcinoma (HCC) using alpha fetoprotein (AFP) as tumor marker and long term follow-up study, a new concept concerning the natural course of HCC has been developed. Adverse to the previous concept of relative short survival, HCC exists and develops for a relatively long period before symptoms occur. A group of pathologically proven HCC cases receiving nonresectional treatment revealed that the median survival of subclinical HCC was 14 months versus 3 months in clinical HCC. 10 more months should be added from the first appearance of low but gradually increasing AFP of subclinical HCC, so the natural course of HCC is about 24 months. This relatively long period provides much more opportunity for successful treatment of this grave malignancy if it is detected early.

Orthoplasty for Bile Duct Stricture at the Liver Hilum, A Preliminary Report of 5 Cases,
Ruitu Ran. 1981, 6p
Included in Chinese Medical Jnl., v94 n9 p611-616 1981.

The current operative treatment for stricture of the bile ducts at the liver hilum has been anastomosis of the proximal bile duct with a defunctioned limb of the jejunum. Such an operation bypasses a functioning papilla and leaves the proximal biliary system open to possible ascending infection from the intestines. This study is a preliminary report of 5 clinical cases of this type of stricture successfully treated by plastic repair of the bile duct at the hilum without intestinal anastomosis. The functioning papilla, a prerequisite for this operation, prevents ascending infection in the biliary system.

Changing Patterns of Fertility: The Impact of Contraceptive Technology on a Maya Village.
1980, 92p AID-PN-AAH-954
Grant AID/pha-G-1184
Sponsored in part by Research Inst. for the Study of Man, New York.

Acceptance and implementation of strategies to limit family size have increased among the women of Chan Kom, a Mayan peasant village located in Yucatan. This report explores the factors supporting fertility control by analyzing the counseling and services of the family planning program and the age, health condition, and desired number of children of women who accept and use some form of birth control. Also assessed are socioeconomic variables such as the education level of women and children and income-generating work of women and men both in and outside the village.

Design of an Evaluation of PSRO Long-Term Care Review.
Final rept.,
Maura Bluestone, Eugene Rubel, and Franz Jaggar.
2 Oct 81, 164p TR-81W-038
Contract HCFA-500-80-0049

This is the final report from a project to design the evaluation for the long term care review component of the Professional Standards Review Organization (PSRO) program. A research design was formulated to test hypotheses of PSRO LTC review effectiveness in assuring appropriate utilization of services by Federal patients and adequate quality of service. As part of the assessment process requisite data sources were identified. A generic methodology which is generalizable to other long term care applications is provided, sixteen hypotheses are specified, a long term care patient flow model, a interstate PSRO model and intrastate PSRO model are conceptualized, and appropriate analytical techniques are recommended. A glossary and references are provided. Implementation of the evaluation design was not within the scope of this project. The authors conclude that it is possible to test specific hypotheses and evaluate PSRO utilization and expediture effects. Given the costs of primary data collection associated with quality of care hypotheses this area is less promising.

Evaluation of a New Community Rape Treatment Center,
Conrad L. Sobczak. May 79, 15p NIMH-81-51
Grant R01-MH-28996
Portions of this document are not fully legible.

A new medical treatment and counseling program for victims of rape and their families was evaluated. Instruments for data collection and monitoring were developed. The input of the program on the community was measured. A model treatment program which facilitated linkages with other agencies was designed and successfully operated.

Physicians and Financial Incentives,
Jon R. Gabel, Judith Taylor, Nancy T. Greenspan, and Martha O. Blaxall. Dec 80, 142p HCFA/PUB-03067

In 1975, the Division of Health Insurance Studies of the Social Security Administration, the predecessor to Health Care Financing Administration's Office of Research, Demonstrations, and Statistics (ORDS), funded approximately 10 research projects on costing. The papers in this volume focus on the way physicians are paid by third party payers rather than the size and significance of patient cost-sharing. Together with other research projects from HEW's Health Resources Administration and in-house HCFA research, the 14 papers contained in this volume summarize selected project findings.

Federal Regulations, Statutes, and Reporting Requirements as Barriers to Efficient Medicaid Program Operations,
Nancy Greenspan. Jul 81, 114p
Grant SRS-18-97959

State administrators believe that Medicaid is a well-run program, but that federal requirements do not always recognize state concerns and efforts to ensure the efficiency and fiscal integrity of program operations. This project is based on discussions between state and federal officials; it recognizes important and longstanding concerns of state administrators, who perceive some current federal requirements as barriers to meeting their primary objectives: to make the best use of available resources; to operate programs efficiently to minimize cutbacks in service or eligibility; and to manage cutbacks so that the least harm is done to program recipients.

Pilot Program for the National Environmental Specimen Bank. Phase I.
Final rept.,
Sally H. Harrison, Rolf Zeisler, and Stephen A. Wise. May 81, 6p
Pub. in Environmental Protection Agency, Washington, DC. Rept. no. EPA/600/S1-81-025, 6p May 81.

This work was performed under a joint NBS/EPA research program to develop state-of-the-art protocols for the sampling, storage, and analysis of biological and environmental-type matrices. This report summarizes the procedures used in the initial phase of a pilot program for determining the feasibility of the National Environmental Specimen Bank. A special clean-laboratory/storage facility has been designed and completed for use in this program. Detailed protocols for sampling, storage, and analysis of human liver samples have been designed for this study. The implementation of these protocols for human liver samples is described in this report.

Brain Destruction Alone Does Not Elevate Brain Aluminum.
Final rept.,
Roger D. Traub, Theodore C. Rains, Ralph M. Garruto, and D. Carleton Gajdusek. Aug 81, 5p
Pub. in Neurology 31, n8 p986-990 Aug 81.

Graphite furnace atomic-absorption spectroscopy was used to measure aluminum concentrations in brain samples from 33 patients dying from a variety of neurologic diseases. Four samples from patients dying of nonneurologic causes also were studied. Nine samples (one from each of nine patients) of Creutzfeldt-Jakob disease brain contained normal amounts of aluminum. Aluminum was increased in 9 of 18 brain specimens with seven different pathologic processes. This included three of seven Alzheimer disease, two of three Huntington disease, two of two Parkinson disease, one of one progressive supranuclear palsy, one of one acoustic neuroma, one of two cerebrovascular disease, and one of two Guamanian amyotrophic lateral sclerosis (ALS). Aluminum was normal in the remaining samples (four normal, two ALS, one multiple sclerosis, one Pick disease, and two Guamanian parkinsonism-dementia). The significance of high aluminum values is not clear, but the normal values from the Creutzfeldt-Jakob cases imply that neuronal destruction per se need not lead to accumulation of aluminum in the brain.

Comparison of the Caries-Preventive Effects of Neutral Sodium Fluoride and Acidulated Phosphate Fluoride.
Final rept. 30 Sep 77-29 Sep 81,
Craig C. Sherbrooke, Lawrence A. Thibodeau, Carolyn K. Goodman, and Laurie B. Follit. Sep 81, 55p G-124, NIDR/CR-81-09
Contract N01-DE-7-2411

The purpose of this study was to determine the caries-preventive effects of neutral sodium fluoride and acidulated phosphate fluoride when each is used daily as a tablet or as a rinse. Approximately 1,300 students participated in the 3-year longitudinal clinical trial. Visual-tactile examinations were conducted four times. Findings indicate the control group had larger mean DMFS increments than either fluoride treatment and either method of administration. While tablets performed better than rinses and APF better than NaF, none of the differences was statistically significant.

The Community Mental Health Project: Pilot Project.
Final rept.,
Elizabeth W. Cleino. Apr 70, 93p VA/NPR-84

This study is the final report of a pilot project conducted by the Community Health Committee, Tuscaloosa Veterans Administration (VA) Hospital, to determine the feasibility of a community based treatment program in connection with a neuro-psychiatric VA Hospital. The six month project was carried out in a rural county where travelling teams provided mental health services for a selected group of discharged veterans. The study concludes that the Community Mental Health Project demonstrates the feasiblity and practicality of extending services to their home community. The travelling team found that by working with families in their own setting the whole truth can be shared and treatment can be more effectively planned and carried out. Recommendations include establishing an extended treatment project to bring community services to a larger area. The scope of the extended project is foreseen to include attention to the existing cultural patterns in the community and work with local citizen groups to improve the general mental health of the community.

Issues in Physician Reimbursement: Conference Proceedings,
Nancy T. Greenspan. Aug 81, 217p HCFA/PUB-03121

The Health Care Financing Administration (HCFA) funded surveys to collect data on physicians' costs and incomes for the years 1975 through 1978. In 1978, HCFA supported the analysis of these data. Although the major focus was the analysis of physician practice costs and incomes for use in refining the Medicare Economic Index, the breadth of the data allowed numerous other reimbursement issues to be addressed. This book contains the first reports emanating from this research.

The publication is a monthly report containing data on medical assistance payments and recipients of services under Title XIX of the Social Security Act (Title XIX). Medicaid is an assistance program designed to provide medical assistance to specified groups of needy individuals. Information is compiled and reported by each State and/or jurisdictional agency administering an approved Title XIX program on Federal Report Form SRS-NCSS-120: Monthly Statistical Report on Medical Care. Information presented include medical payments by form of payment, payments to medical vendors by type of service, number of recipients in whose behalf medical vendor payments were made, and data related to screening services under the Early and Periodic Screening Diagnosis and Treatment program.

Contents:
- Clinical analysis of 120 cases of primary amenorrhea;
- Influence of late-pregnancy toxemia on the fetus;
- Reevaluation of fosfomycin--clinical and laboratory studies;
- Studies on the rapid detection of dengue virus antigen by immunofluorescence and radioimmunoassay;
- Astrovirus in autumn infantile gastroenteritis;
- Anticomplement immunoenzymatic method of detecting Epstein-Barr nuclear antigen in nasopharyngeal carcinoma cells and normal epithelial cells;
- Androst-4-ENE-3 beta, 17 beta-diol dicyclopentylpropionate combined with traditional Chinese drugs in chronic aplastic anemia;
- Wilson's disease (Hepatolenticular Degeneration)--clinical analysis of 80 cases;
- Long-term results of cerebral hemispherectomy--follow up study of 4 cases with observation of a 22 year survivor;
- Tuberculosis and its control in Beijing;
- A new concept on chiasmal architecture and its projection on the retina;
- In vitro cultivation of M. Leprae.

Clinical Analysis of 120 Cases of Primary Amenorrhea,
Qinsheng Ge, Liyu Huang, Yiwen Zhang, Chunxia Gu, and Yihua Li. Oct 81, 10p
Included in Chinese Medical Jnl., v94 n10 p629-638 1981.

120 primary amenorrhea cases are clinically analyzed and 10 different causes are evaluated. 69.2% are due to congenital causes, congenital ovarian dysgenesis is the most frequent, while pure gonadal dysgenesis the second. Diagnosis for each kind is introduced. Clinical manifestations such as height, secondary sex characteristics, virilism and hirsutism and external and internal genitalia are hints for differentiation of various diagnosis. Management for each kind is discussed.

Influence of Late-Pregnancy Toxemia on the Fetus,
Yunfang Wang, and Yanhe Xu. 1981, 6p
Included in Chinese Medical Jnl., v94 n10 p639-644 1981.

Toxemia of late pregnancy greatly influences fetal survival. The fetal mortality rate is 10.71% being 1-5 times above normal. The main causes of fetal death are prematurity, intrauterine anoxia, asphyxia, premature placental separation, hyperplacentalism, etc. Besides the onset and duration of the attack, severity of toxemia has a close relationship with fetal death. The prevention and management are: intensive treatment, use of the placental function test to judge the in utero fetal condition and stressing 5 indications for termination of pregnancy.

Studies on the Rapid Detection of Dengue Virus Antigen by Immunofluorescence and Radioimmunoassay,
Fuxi Qiu, Haoyan Zhang, Lan Shao, Xuedong Li, and Huirong Luo. 1981, 6p
Prepared in cooperation with National Inst. for Control of Pharmaceutical and Biologic Products, Beijing.
Included in Chinese Medical Jnl., v94 n10 p653-658 1981.

Addition of fluorescein isothiocyanate-labeled or 125I-labeled immune ascitic fluid IgG antibody against Type 4 dengue virus onto brain imprints of newborn mice and coverglass cultures of Aedes albopictus mosquito cell line infected with the prototype strain of Type 4 dengue virus showed specific fluorescence in the cytoplasm which could be inhibited by unlabeled specific antibody or gave a positive result by radioimmunoassay in all of them. Results in all the corresponding uninfected imprints and coverglass cultures were negative. When labeled antibodies were added onto those infected with Type 2 dengue virus or Japanese B encephalitis virus, no positive results were obtained by immunofluorescence or radioimmunoassay. Results by these two methods in a proportion of the head squashes of laboratory-bred female Aedes albopictus mosquitoes which had sucked the blood of mice infected with Type 4 dengue virus were positive, whereas in those mosquitoes which had not sucked the blood of infected mice the results were all negative. Type 4 dengue virus antigen was positive by both methods in a proportion of head squashes and of salivary gland, stomach and ovary squashes of female Aedes albopictus mosquitoes captured from the epidemic region of dengue fever. On the other hand, in those female Aedes albopictus mosquitoes bred in the laboratory in nonepidemic region, the results were all negative.

A New Concept on Chiasmal Architecture and Its Projection on the Retina,
Yuanxiu Lao, Weiye Li, Fengrong Ai, Ruyi Wang, and Yuxia Chen. 1981, 8p
Included in Chinese Medical Jnl., v94 n10 p691-698 1981.

A study of several hundred visual fields of patients with pathologic lesions at the chiasmal region in some temporal fields demonstrates a kind of paracentral hemicircular (PCHC) bundle scotoma which was not connected with the blind spot. The particular pattern of these scotomas prompts the authors to advance a new concept on the chiasmal architecture and its projection on the retina. That is each paracentral fiber bundle on the retina divides into different districts, the fibers from the corresponding districts of each bundle weave compactly into the exact lamella in the chiasma, and with this presumed fiber arrangement, there is the resultant appearance of PCHC bundle scotoma.

Evaluation of the Colorado Clinical Psychology/Expanded Mental Health Benefits Experiment. Executive Summary.
Research rept.,
Nelda McCall, Thomas Rice, and Bruce Steinhardt. Oct 81, 49p
Contract SSA-600-76-0168
See also Volume 1, PB82-136151. Errata sheet inserted.
Also available in set of 6 reports PC E99, PB82-136136.

The Colorado Clinical Psychology/Expanded Mental Health Benefits Experiment tested two alterations in the Medicare Program: (1) decreasing the copayment rate for outpatient mental health services from 50% to 20%, and (2) recognizing clinical psychologists as independent practitioners. The experiment conducted from October 1976 to December 1978, randomly assigned Medicare beneficiaries to four groups, representing the combinations of experimental and standard benefits. The evaluation had two primary components: (1) assessing the operational aspects of administering the experimental benefits including the processes of selecting qualified psychologists, establishing a quality assurance system, and implementing reimbursement procedures; and, (2) determining their impact on the use, cost, and delivery of mental health and medical services reimbursed under Medicare in terms of the number of beneficiaries using mental health services, the intensity and cost of mental and medical service use, substitution of mental health services for nonmental-health medical services, provider billing and treatment patterns, substitution of outpatient mental health services for inpatient services and the distribution of providers. The report also provides analyses of beneficiaries 'and providers' characteristics and attitudes and the relationship between use and cost of mental and medical services.

Veterans Administration Medical Center, Little Rock, AR.
Evaluation of the Program of Nursing Services,
Christine Boren, and Marjorie C. Poole. Apr 81, 75p
VA/NPR-149

This retrospective study was conducted at Veterans Administration (VA) Medical Center, Little Rock, Arkansas, to generate a profile of the NHCU veteran population, determine a baseline of nursing services for future program planning and allocation of resources, and identify sources for nursing studies and research. Information was collected by interview and questionnaire and from a wide variety of reporting mechanisms, and administrative documents. Results indicated that the NHCU is largely accomplishing its goal for providing basic nursing services, and quality of life. Skilled nursing services of a rehabilitative and teaching nature, and therapeutic programs require greater achievement and additional resources. Opportunity for research exists at all levels of geriatric clinical practice, especially in the realm of behavior management. It includes a bibliography.

Effects of Exercise Training on Lipid and Carbohydrate Metabolism in Hemodialysis Patients.
Annual rept. 1 Oct 80-30 Sep 81,
Andrew P. Goldberg. 20 Oct 81, 89p AK-1-9-2221-81
Contract N01-AM-9-2221
See also report for 1 Oct 79-30 Sep 80, PB81-221525.

A longitudinal study is in progress in 29 hemodialysis patients to determine the effects of exercise training on their lipid and carbohydrate metabolism, blood pressure control, work capacity, cardiovascular function, anemia, bone-mineral metabolism and phychological function. Patients were randomly assigned to an immediate exercise group (n=22) or a no-exercise control group (n=7). Baseline evaluations excluded patients in whom exercise was contraindicated. Initial treadmill test (GXT) durations and VO2 max levels were 30-50% below normal, and 15 patients had a positive GXT. All patients received dietary assessments and instruction. Exercise training increased GXT duration by (17.3%, $p<.005$) and VO2 max (18.6%, $p>.025$). There were reductions in plasma triglyceride (-15%, $p<.05$), increases in high density lipoprotein cholesterol (+15%, $p<.01$) and improvements in glucose tolerance and insulin receptor affinity. These metabolic parameters did not change in the no-exercise controls. Blood pressures decreased in the hypertensive patients. Increases in hematocrits ($p<.01$) and hemoglobin concentrations ($p<.01$) occurred in 6 men. Red cell survival normalized in the 2 patients who were studied. Reductions in serum phosphate, parathyroid hormone and alkaline phosphatase levels were observed in the most vigorously trained patients. Exercising patients also had improvements in depression, mood and social adjustment. Thus, vigorous exercise training seems to improve abnormalities in lipid and glucose metabolism and hematologic function, reduce blood pressure, benefit bone-mineral metabolism and improve psychological function in patients with endstage renal disease requiring hemodialysis.

The Non-Invasive Evaluation of the Coronary Artery Disease Patient: Clinical, Economic, and Social Issues,
Alfred F. Parisi. 1981, 29p
Sponsored in part by National Center for Health Services Research, Hyattsville, MD.
Included in Proceedings of Coronary Artery Bypass Surgery, p50-77, Nov 81.

Potential candidates for coronary artery bypass surgery (CABS) see a cardiologist for one of several reasons, including chest pain, recent myocardial infarction, a 'positive' stress test (usually an exercise electrocardiogram), and anticipation of another extensive (usually vascular) surgical procedure. In the largest subgroup, patients symptomatic from chest pain, the history and physical examination are the key elements in determining the extent and direction of subsequent testing and the possibility of medical intervention, surgical intervention, or both.

Lewin and Associates, Inc., Washington, DC.
Differential Reimbursement of Hospitals.
Final rept.
Sep 81, 261p
Contract HCFA-600-77-0073

The objective of this study was the development of a methodology to determine the appropriate level of differential, if any, in reimbursement to short term hospitals by different payers. The study was performed in 15 hospitals, five in each of three states. The hospitals differed in size, complexity, ownership and location. The sample was not selected to be representative of different hospital types in the United States and the results were not weighted to project the results on that distribution of hospitals. The major analytical tasks performed under this contract included identification of: The extent of differences in the intensity of nursing time by third-party payer; the extent to which third-party payers consume different levels of resources in hospital business functions; the extent to which practices both of hospitals and of third-party payers affect cash flow to hospitals; the effect of various patterns of insurance coverage on patient responsibility, bad debts and charity care; and the extent to which a particular reimbursement methodology can determine reimbursement due a hospital from a third-party payer.

Medicaid Nursing Home Reimbursement in Minnesota (Volume 3),
Bruce Spitz, and Jane Weeks. 27 Sep 79, 105p 1216-5
Contract HCFA-600-77-0070

This report examines the politics and economics of Medicaid nursing home reimbursement in the State of Minnesota. It traces the development of the rate setting mechanism, identifies political trends and considerations among the principal actors, and analyzes the economic incentives in the reimbursement system adopted by the State in 1977. The Minnesota reimbursement system is the product of strong legislative intervention and extensive regulatory and legislative detail. The legislative involvement was a result of the industry's lobbying for reimbursement policy changes which the executive branch was unwilling to grant and, to some extent, the notoriety surrounding the River Villa nursing home expose.

Urban Inst., Washington, DC.
Medicaid Nursing Home Reimbursement in Connecticut (Volume 6),
Bruce Spitz, and Jane Weeks. Sep 79, 90p 1216-2
Contract HCFA-600-77-0070

This report examines the politics and economics of Medicaid nursing home reimbursement in the State of Connecticut. It traces the development of the rate setting mechanism, identifies political trends and considerations among the principal actors, and analyzes the economic incentives in the reimbursement system adopted by the State in 1976. The study found that two factors influenced the way Connecticut formulated Medicaid reimbursement policy. These were: (1) the perceived Federal legislative commitment to assure that States reimburse on a cost related basis and (2) the widely publicized New York nursing home scandals. The Moreland Act Commission Report, which was a result of an investigation of these scandals, served as a guide for the studies conducted in Connecticut. In addition, the Moreland report provided a prototype for the State's capital reimbursement methodology.

Urban Inst., Washington, DC.
Medicaid Nursing Home Reimbursement in Colorado (Volume 7),
Jane Weeks, and Bruce Spits. Sep 79, 65p 1216-1
Contract HCFA-600-77-0070

This report examines the politics and economics of Medicaid nursing home reimbursement in the State of Colorado. It traces the development of the rate setting mechanism, identifies political trends and considerations among the principal actors, and analyzes the economic incentives in the reimbursement system adopted by the State in 1966 and used by Medicaid since the beginning of the program. Colorado's reimbursement policy has remained remarkably stable since a cost related system was implemented by the Department of Social Services. Three factors have contributed to this stability: (1) the continuity among a small group of critical actors; (2) the easily understood system design that permitted providers an adequate return while preventing excessive profits; and, (3) until recently, a virtual absence of nursing home scandal.

PB82-139932 PC **A03**/MF **A01**
Urban Inst., Washington, DC.
Medicaid Nursing Home Reimbursement in Louisiana (Volume 8),
Jane Weeks, and Bruce Spitz. Apr 78, 29p 1216-00
Contract HCFA-600-77-0070

This report examines the politics and economics of Medicaid nursing home reimbursement in the State of Louisiana. It traces the development of the rate setting mechanism, identifies political trends and considerations among the principal actors, and analyzes the economic incentives in a reimbursement system which has not changed since the enactment of Medicaid. The dominant force shaping Louisiana's reimbursement policy is the State's desire to hold down costs by maintaining strict control over program expenditures. The low income level of the State's residents result in revenues which simply cannot support expansive programs. In order to project expenditures, the State employed a negotiated flat rate nursing home reimbursement system since the beginning of the program. At the time of the study, the State was developing a simple cost related reimbursement system as required by Federal regulations.

Biotechnology in Agricultural Research (Biotechnologie in het Landbouwkundig Onderzoek).
Study rept. no. 9.
c1981, 75p
Text in Dutch.

In view of the great efforts made in the United States and Japan in the area of bio-bulkprocesses and enzymatic hydrolyses with single enzyme systems there appear to be opportunities for Holland to come up with innovations in 'fine' biotechnology and the rather trying systems. This report which treats the subject deals with the integration of one or more biologic disciplines and processing technologies leading to an improved (or new) production process in which live materials, or materials from a live source, are input into a biochemical reaction process. The report lists the biotechnological activities of the various Dutch agriculturally related organizations, institutes and research centers and the interaction of all the agricultural sciences (the circle of disciplines) with the application sciences (the circle of applications). Seven areas have been selected as having especially important potential for results in this field: Plant cell and tissue growth, Dairy biotech-

nology, Carbon hydrate biotechnology, Energy related biotechnological research, Biotechnological production of bioinsecticides, Exploitation of animal cells and potentials in vitro biogenetic syntheses and biomimetics.

Public Health Service, Rockville, MD. Office on Smoking and Health.
Smoking and Health, A Report of the Surgeon General.
11 Jan 79, 1202p DHEW/PUB/PHS-79-50066

This volume updates and greatly expands the current knowledge about all aspects of smoking and health first published in 1964 by the Surgeon General's Advisory Committee on Smoking and Health. Three major areas are critically reviewed and assessed: the health consequences of smoking; behavioral aspects of smoking; and educational and prevention aspects of smoking and tobacco use. Over 3,300 references are cited in this 1,200 page report updating information linking smoking to many major disease areas including the following: overall mortality and morbidity, heart disease, cancer, chronic obstructive lung disease, and outcomes of pregnancy. In addition the report covers such areas as peptic ulcer disease, interactive effects of smoking and occupation, involuntary smoking, smoking and allergy and immunity, constituents of tobacco and tobacco smoke, and the effects of smoking on drugs, food constituents and diagnostic tests. The section on behavior discusses biological as well as behavioral influences on initiation, maintenance and cessation of smoking and the psychosocial determinants of smoking behavior in children and adolescents. An appendix on smoking behavior trends in the United States from 1950 to 1978 is presented. A complete subject index to all major topics in the Report is also included.

An Evaluation of the National Heart, Lung and Blood Institute's Pulmonary Academic Award Program.
Final rept. 1 Sep 80-30 Nov 81,
Charles R. Sherman. 30 Nov 81, 133p
Contract N01-HR-0-2907

A decade ago there were few strong academic programs in pulmonary medicine in the United States. A number of major discoveries about the respiratory, circulatory and other body systems opened strongly promising avenues of research into causes and cure of pulmonary disease. There were clearly perceived needs to integrate the disciplines that treat the lung, to build upon the new pulmonary knowledge base, to translate the growing knowledge into improved health care techniques, and to assure that new physicians are educated in modern pulmonary medicine. Recognizing these needs and shortages, the Division of Lung Diseases at the National Heart, Lung and Blood Institute, as part of its manpower development program, established the Pulmonary Academic Award Program (PAA) to stimulate the development of pulmonary academicians and to improve pulmonary curricula.

Coal and Nuclear Wastes--Both Potential Contributors to Environmental and Health Problems.
21 Sep 81, 26p Rept no. GAO/EMD-81-132

The literature confirmed that wastes produced by both fuel cycles present the potential for significant environmental and health hazards. Although coal has been used considerably longer than nuclear, its environmental and health effects are not as fully understood. In fact, coal wastes were not even recognized as potentially hazardous until recent years. Thus, little information has been compiled to measure or evaluate coal waste risks. Nuclear wastes, on the other hand, were always considered potentially harmful because of their recognized radioactivity and the perceived consequences of an accident. Because of this, the possible environmental and health effects of all nuclear wastes have been carefully studied, evaluated, and documented by both the Federal Government and the nuclear industry. The biggest uncertainty with nuclear wastes is the lack of a demonstrated solution to the permanent isolation of high-level waste or spent reactor fuel. Since coal and nuclear wastes present different types of hazards and the information available on these wastes is not comparable, we did not believe it was possible to determine if either waste type is more of a hazard than the other. Nonetheless, several comparisons of the waste amounts, potential hazards, and past environmental and health effects resulting from each respective fuel cycle can be made that provide a perspective on the individual hazards of each waste type. Biological Activity and Chemical Characteristics of Dredge Material from 10 Sites on the Upper Mississippi River,
Leif L. Marking, Verdel K. Dawson, John L. Allen, Terry D. Bills, and Jeff J. Rach. Oct 81, 152p

The U.S. Environmental Protection Agency (EPA) and the U.S. Army Corps of Engineers (COE) are responsible for developing guidelines to regulate the disposal of dredged material. Many governmental and private interest groups in the Mississippi River basin are concerned about potential hazards associated with the possible release of contaminant substances during dredging activities and the deleterious effects that resuspended materials may have on aquatic organisms. This study was conducted to determine the biological activity and chemical characteristics of dredge material from 10 sites in the Upper Mississippi River between St. Paul and Winona, Minnesota. Funds for the study were provided by the St. Paul District of COE.

A New Approach for the Control of Cockroaches Utilizing the Entomophilic Nematode DD-136 in Conjunction with Attractants.
Annual rept. no. 1,
G. Mallory Boush. Oct 81, 23p
Contract N00014-80-C-0080

The broad overall objective of this project is to develop a successful pest management scheme to control cockroaches on board naval ships and on shore facilities, based on the use of promising entomophilic nematodes in conjunction with baits, attractants and harborage-inoculation devices. In addition, four juvenile hormone analogs were evaluated for possible use in controlling cockroaches on naval ships and shore facilities. The entomophilic nematode, Neoaplectana carpocapsae=DD-136, and associated bacterium, Xenorhabdus nematophilus have been tested in the laboratory as far as potential and capacity to infect and kill the German cockroach, Blattella germanica.

Water Quality in the Vicinity of Fenton Hill Site, 1978. Progress Report.
W. D. Purtymun, R. W. Ferenbaugh, A. K. Stoker, W. H. Adams, and J. W. Owens. Jan 80, 22p
Contract W-7405-ENG-36

Water quality data have been collected from surface and ground water stations and from ponds at the Fenton Hill Site located in the Jemez Mountains, as part of a continuing program of environmental studies. There have been slight variations in the chemical quality at individual stations; however, these variations in water quality are within normal seasonal fluctuations. Evaluation of the aquifer furnishing water to the Fenton Hill Site indicates a transmissivity of about 1200 m exp 2 /day. The specific capacity over a five day test was 28 l/s/m of drawdown. There was a slight increase in total dissolved solids in the well water between 1977 and 1978. Water quality and soluble fluoride and chloride in sediments in the canyon that receives excess water from the ponds indicate that these constituents decrease to background within 300 m of the ponds. A water balance of amount produced at the site indicates 7% of the water lost to evaporation from the ponds, 31% lost by infiltration into tuff beneath the ponds, 21% of the water discharged from the ponds, and 41% used for downhole experiments, drilling operations, and general site use. Effects of Acid Precipitation in North America.
Journal article,
N. R. Glass, G. E. Glass, and P. J. Rennie. Oct 81, 10p EPA-600/J-81-348
Pub. in Environmental International, v4 p443-452 1980.

Recent evidence indicates that acid rain is a growing environmental phenomenon of potentially far reaching consequences and increasing geographical extent in North America. Acid rain is but one aspect of the broader problem of atmospheric deposition which includes snow, fog, and dry deposition of material. First noticed and studied in the Scandinavian countries, acid precipitation has now been well documented in the United States, first in the Northeast and now more recently throughout much of the United States east of the Mississippi River. Numerous streams and lakes in regions with poorly buffered soils have become devoid of fish, have an impoverished aquatic flora and fauna, and are changing toward conditions of low aquatic productivity. Evidence also indicates that acid precipitation may cause damage to forest growth, crop production, and man-made materials such as buildings, metals, paints, and statuary.

Influence of Drilling Muds on the Primary Chemosensory Neurons in Walking Legs of the Lobster, 'Homarus americanus'.
Journal article,
Charles D. Derby, and Jelle Atema. Nov 81, 11p EPA-600/J-81-128
Grant EPA-R-806630010
Pub. in Canadian Jnl. of Fisheries and Aquatic Sciences, v38 n3 p268-274 1981.

The effects of whole drilling muds on the normal activity of walking leg chemosensory neurons were examined using extracellular neurophysiological recording techniques. Exposure of legs for 3-5 min to 10-mg/L drilling mud suspended in sea water altered responses to food odors of 29% of the chemoreceptors examined (data polled for the two drilling muds tested); similar exposure to 100-mg/L drilling mud resulted in interference with 44% of all receptors studies. The effects of both of these concentrations are statistically significant, although they are not different from each other. Interference was usually manifested as a marked reduction in the number of action potentials in a response. In one preparation, the exposure to drilling mud caused a change in the temporal pattern of the spikes without affecting the total number of spikes. Other chemosensory neurons were excited by 10-mg/L drilling mud itself. However, not all chemoreceptors are affected by these drilling muds since responses to feeding stimuli were recorded from the legs of lobsters that had been exposed to drilling mud for 4-8 d before the neurophysiological experiments.

Use of Aquatic Oligochaete, 'Lumbriculus variegatus', for Effluent Biomonitoring.
Industrial environmental research brief,
C. Evan Hornig. Dec 80, 11p EPA-600/D-80-005
Contract EPA-68-03-2619

The report describes a simple, inexpensive static bioassay technique using the aquatic oligchaete (earthworm), Lumbriculus variegatus (Muller), to screen cooling-water effluents for environmental toxicity. (Biological approaches to the early detection of toxic agents in industrial effluents and receiving waters generally require complex techniques and equipment, and are often impractical for use in self-monitoring programs or large-scale monitoring networks.) The new method requires only the test organism, holding containers, and temperature control. The test organisms are readily available, require little preparation and maintenance, and are sensitive to a variety of toxicants. Study findings demonstrate the organism's sensitivity to the widely used biocide, sodium pentachlorophenate (96-hour LC50 of 0.57 ppm), and to actual industrial wastes. While further refinement and testing will be required, this simple bioassay appears to hold considerable promise for cost-efficient pre-screening of toxic changes in cooling-water effluents.

Evaluation of Formaldehyde Problems in Residential Mobile Homes.
Final rept.,

Robert Stone, Ben Tucker, Diane DePaso, Edward Shepard, and Emilia Villarreal. Mar 81, 195p HUD-0002070
Contract HUD-H-5105

The magnitude of the formaldehyde problem inside residential mobile homes was examined, and a computer model was developed to help HUD evaluate potential regulatory alternatives specifying maximum formaldehyde levels for new mobile homes. Cost - benefit analysis was the main tool used to evaluate the regulatory alternatives, and it included a range of assumptions and determination of the sensitivity of the cost - benefit results to these different scenarios. Previous mobile home formaldehyde research conducted in Wisconsin, Washington, and Minnesota showed that the number of reported formaldehyde problems in all three states is strongly and negatively correlated with the ages of the mobile homes. A computer model was used to establish the relationship between levels of formaldehyde inside the home and the number of occupants affected by formaldehyde outgassing. Health costs associated with formaldehyde exposure were then examined to establish the baseline costs incurred by mobile home occupants in the absense of regulation. Effects of setting initial limits of 0.1, 0.2, 0.3, and 0.4 parts formaldehyde per million were then examined and compared with the effects of no regulation. Results indicated that the optimal regulatory level could range anywhere from no regulation to a limit of 0.4 parts per million, depending on how extensive the underreporting of formaldehyde problems really is and on the average initial level of formaldehyde currently in new mobile homes. Given the uncertainty regarding the actual values of these important variables, it is impossible to rank the five regulatory alternatives with any degree of confidence. Further research is needed to increase existing knowledge about the level of formaldehyde outgassing in mobile homes and about the frequency and severity of attendant health effects. Field tests in a random sample of U.S. mobile homes are urgently needed. Information is also needed about the costs and effectiveness of the various formaldehyde abatement techniques. Figures, tables, footnotes, and appendices presenting the computer model, analysis of formaldehyde abatement technologies, an injury cost model and an analysis of survey data are presented.

Storage Cost Data on CCC-Owned Dairy Commodities.
18 Sep 81, 8p Rept no. GAO/CED-81-157

As of June 30, 1981, the Corporation's dairy inventories consisted of about 518 million pounds of butter, about 486 million pounds of cheese, and about 871 million pounds of nonfat dry milk. Nearly three-fourths of the dairy products in storage are less than 1 year old. The Government's cost to store dairy products has risen sharply, totaling over $24 million for the first 9 months of fiscal year 1981. By comparison, storage costs for fiscal years 1977-80, when inventories were at lower levels, averaged about $11 million annually. Relatively small quantities of these products are lost due to spoilage while in storage. However, some loss in quality or product deterioration can occur, and when it does, the products are sold at less than inventory value. Only the nonfat dry milk is sold on a restricted basis (not to be used for human consumption). (Author)

USAF Food Habits Study. Part IV. Selections, Quantities Selected, and Perceived Portion Sizes.
Technical rept.,
Kerry W. Wyant, and Herbert L. Meiselman. Jul 80, 62p Rept no. NATICK/TR-81/025
See also Part 3, AD-A101 020

This report presents results of the 3rd of 3 data collection efforts undertaken at Travis AFB to provide information describing the food habits of AF personnel. The report focuses on food selections, quantities of food selected, and perceptions of the sizes of food portions as they are made available. The Food Selection Questionnaire was modified for the present study to allow the respondent to report having selected as many as three servings of a food, and to allow the respondent to indicate his perception of serving sizes. It was administered during two breakfast meals and four noon meals. Food selections of whites and blacks and males and females for certain food items tended to be consistent with 1977 food preference data, and the number of servings of food selected tended to be related to the perceived portion size as well as to the 1977 food preference data. Perceived portion size tended to be inversely related to the food preferences. In all instances, correlations were most meaningful for foods preferred by whites. Whole milk, tacos, grilled bacon, and carbonated beverages were among the most frequently selected foods. Based on self-reported weights and the Metropolitan Life Tables, half of the males were overweight (OW) while the majority of white females were average weight (AW). When the weight tables were adjusted for clothing, the majority of the personnel sampled were OW. In contrast to the AW who attended the dining halls, the OW tended to select high-density, saturated fatty foods. Results based on 1977 food diaries indicated that the OW tended to eat a greater number of breakfasts across a three-day period than did lighter respondents.

Defense Intelligence Agency, Washington, DC. Directorate for Scientific and Technical Intelligence.
Nutrition Research--USSR,
Victoria Dibbern. 30 Oct 81, 43p Rept no. DIA-DST-1810S-144-81

This report reviews selected Soviet nutrition research having military significance in terms of meeting nutritional requirements in typical military environments, as well as in adverse natural environments in which military forces operate. Addressed are nutritional requirements in cold and hot environments and at high altitudes, as well as nutritional requirements with physiological and psychological stresses caused by such factors as noise, decompression, flight, toxic environments, and mental and physical work. Therapeutic and prophylactic uses of various nutrients are also reviewed, particularly in relation to a specific kind of stress. Also included in this report is an overview of Soviet nutrition--its organization, history, leading institutes and personalities, and important areas of research. The last section comprises an assessment, not only of the research reviewed for this report, but of Soviet nutrition research in general. This is based on the author's monitoring of the Soviet nutrition literature over the past 10 years, as well as on assessments made by others who have either visited the USSR or have made a considerable effort to become knowledgeable about Soviet nutrition research. This study is an intelligence community initiative performed under the Defense Intelligence Agency task, Selected Topics in Biological Sciences.

Evaporation by Mechanical Vapor Recompression. Technical Progress Report, April 1, 1980-June 30, 1980.
C. H. Iverson, and G. E. Coury. 1980, 81p
Contract AC03-79CS40208

The expected performance and estimated capital cost are presented of two schemes for the application of mechanical vapor recompression to a conventional, low pressure, five effect juice evaporator in a beet sugar factory. Due to the constraints of the existing system and the desire to make the most effective use of the capital investment, the recommendation is to install Scheme B. This selection recognizes the inability of the falling film evaporator to respond to rapid and frequent changes in capacity, and upon the need to raise the first effect vapor pressure to allow utilization of first effect bleed vapor to boil the white sugar crystallization pan. The recommended installation, Scheme B, is predicted to reduce the hourly steam consumption by up to 10,477 number/hr for an annual fuel savings of $126,800 on today's fuel cost at the Greeley Factory of the Great Western Sugar Company. This represents a 9.35% reduction in the amount of steam generated during the base year of 1978 to 1979. The estimated capital cost of the installation is $825,000. (ERA citation 05:032482)

Evaluation of Low-Cost Extrusion Cooker in Sri Lanka.
Special rept.,
A. A. Ackels, R. E. Gaylord, and E. E. Kuphal. Jul 77, 132p LEC-3, ID77-78-1, AID-PN-AAH-435

The low-cost extrusion cooker (LEC), a simple system used to convert indigenous grains into low-cost, nutritious foodstuffs, was developed to reduce dependence on food-for-peace programs as a means of solving LDC food supply problems. This paper evaluates the performance of a pilot LEC system in Sri Lanka, determines its suitability for use in other LDC's, and recommends changes and improvements. The investigating team spent 10 days onsite evaluating Sri Lanka's LEC system, which used the Brady Crop Cooker to cook soybeans for farm animal consumption. The evaluation focused on raw materials used, grain cleaning and storage processes, operating and performance of the B.C. and support equipment performance. The team noted improper usage of tools and parts, lack of spare parts, and machines operating with missing or damaged parts. Final recommendations for Sri Lanka LEC are: (1) to investigate and install continuous-duty equipment so that a 98% 120-hr. equipment reliability factor can be reached, (2) to improve LEC maintenance so as to increase production to at least 70% of its maximum production capacity. The authors urge prompt initiation of pilot plant LEC development program to increase world use of the system.

Application of Intermittent Ignition Devices to Commercial Cooking Equipment.
Final rept. Jan-Dec 78,
R. L. Himmel, and R. E. Stack. Jan 81, 40p GRI-78/0050
Contract GRI-5010-341-0051

This report describes the work conducted in attempts to coordinate efforts of manufacturers of commercial cooking equipment in the investigation of residential noncontinuous pilot ignition devices for possible application to commercial cooking equipment. The term Intermittent Ignition Device (or IID) is used as an incluse term and not as the true identifier of a particular type of ignition device. Included is the description of experimental laboratory studies to determine which noncontinuous pilot ignition devices could best function in a simulated commercial kitchen environment. Results of the laboratory tests indicate that there are no known ignition devices currently on the market which will satisfy the broad range of requirements for all types of commercial cooking equipment. It was also determined that due to the harsh environmental requirements, manufacturers of electric ignition devices were not readily stimulated to begin a research program aimed at the development of an ignition device which would satisfy the necessary requirements.

Commercial Cooking Equipment Improvement.
Annual rept. Jan-Dec 80,
R. L. Himmel. Oct 81, 61p GRI-80/0080
Contract GRI-5080-345-0255

This report describes the continuing efforts of a project aimed at improving the efficiency of gas-fired commercial cooking equipment. It specifically discusses work on deep fat fryers, range oven sections, range open top sections, range hot top sections, and range fry top sections. The infrared deep fat fryer development which demonstrated an efficiency improvement of 25 percent over conventional units was completed. Range oven work was also completed. Fuel consumption for baking cakes was further reduced to demonstrate a 55 percent reduction with the direct fired forced convection approach. A 33 percent improved range open top burner system is described which utilized an experimental power burner. Preliminary modifications to heavy duty range hot top and fry top sections demonstrated fuel savings of 43 percent and 30 percent respectively. These initial results were also obtained with laboratory type experimental burner systems and as such, all range top work needs to be continued to research other approaches and demonstrate the improved technologies on more complete experimental models.

Improvements Needed in Assessing Penalties and Controlling Penalty Collections Resulting from Occupational Safety and Health Inspections.
15 Sep 81, 10p Rept no. GAO/HRD-81-150

The Occupational Safety and Health Administration's (OSHA's) inspection program is its primary means of insuring safe and healthful working conditions for about 73 million employees protected by the Occupational Safety and Health Act of 1970. During fiscal year 1980, about 132,000 violations were cited and penalties totaling about $23 million were proposed. We reviewed the adequacy of the accounting controls and procedures used by OSHA and the Office of the Solicitor for processing penalty cases and collecting and safeguarding penalty payments. Our review showed that (1) weaknesses exist in internal controls and the recordkeeping system used to account for penalties and (2) it is taking too long to deposit penalties received into the U.S. Treasury. We are also providing information on regional solicitors' policies for processing contested and collection cases. OSHA has recognized that improved internal controls and recordkeeping are needed and has made a commitment to develop improved controls and records. (Author)

SRI International, Menlo Park, CA.
Industrial Hygiene Survey Report at Celotex Corporation, Pittston, Pennsylvania.
Industrywide study,
Douglas P. Fowler. 4 Oct 77, 90p IWS-35.31
Contract PHS-NIOSH-210-76-0120

Air sampling, noise and ventilation surveys were conducted at a facility of the Celotex Corporation (SIC-3296) in Pittston, Pennsylvania, on October 4, 1977. First air was administered by supervisors and trained hourly employees. Pre-employment and periodic examinations were given. The facility had an industrial hygiene supervisor. Earplugs and safety glasses were given to all employees whose job required them. High noise levels were found in the cupola and tile line areas and during the use of air line for cleaning processing equipment. Housekeeping was generally adequate. The enclosure around the spinner in the cupola area did not prevent occasional ejection of molten slag and metal, and emission of fumes and smoke into the area where the cupola operator was located. The potential for inhaling toxic material was found in some areas. Workers were not exposed to total particulate material concentrations above the OSHA limit. The highest respirable particulate value was 1.661 milligrams per cubic meter and all respirable samples were below the OSHA limits. The author recommends replacing Wollastonite with a non-fibrous substitute in the paint mix area, the use of protective gear, periodic maintenance and monitoring of the ventilation system and noise levels, ventilation and cupola area improvements, surveying workers for asbestos exposure and close medical surveillance of workers exposed to airborne Wollastonite.

Asbestos Dust and Preliminary Industrial Hygiene Survey at World-Bestos, the Firestone Tire and Rubber Company in New Castle, Indiana.
Industrywide study,
John Dement. Sep 71, 24p IWS-32.35B

Workers exposures to asbestos (1332214) were determined at the World-Bestos division of the Firestone Tire and Rubber Company (SIC-7539) in New Castle, Indiana, from September 20 to 24, 1971. The facility employed approximately 225 workers and had a safety director with no staff. No doctors or nurses were employed at the facility. Respirators were worn by wet and dry mixing operators and in the truck block performing operations. Ear protection devices and aprons and gloves were supplied by the company. Samples taken with a filter membrane ranged from 0.1 fibers greater than 5.0 microns in length per cubic centimeter (f/cc) for a surface grinder to 33.6f/cc for one hot press operator. The author concludes that potential hazards are exposure to asbestos dust, lead from mixing operations and noise. He recommends modifications and improvements in the ventilation systems, use of a vacuum system to clean-off machines and work clothes, and reductions in the noise levels of the hopper vibrator in the wet mix area.

Men's Apparel Industrywide Study at Gant Shirtmakers Division of Consolidated Foods, Salisbury, MD.
Industrywide study,
Peter J. Nord. 19 Sep 74, 6p IWS-46.19

Hazards associated with the man's apparel industry were surveyed on May 9, 1974, at Gant Shirtmakers (SIC-2321) in Salisbury, Maryland. The company employed 50 cutters and 300 stitchers. Some workers were trained in first aid, and a local physician was available for serious injuries. The safety committee was composed of foremen, maintenance men and the general manager. Materials used were permanent press cottons and synthetics. Air conditioning was used for ventilation. Dust and lint was found in a few areas of the facility, but no sampling was performed. Noise levels were below 60 to 87 decibels, and lighting levels were 100 to 500 foot candles. The author concludes that dust and lint may pose a respiratory hazard, especially if formaldehyde is released. Recommendations include characterization of airborne dust, testing of pulmonary function among the workers, determination of time weighted average noise exposures, and audiometric testing of workers exposed to noise levels greater than 85 decibels.

Industrial Hygiene Survey Report at U.S. Gypsum Corporation, Birmingham, Alabama.
Industrywide study,
Douglas P. Fowler. Apr 78, 74p IWS-35.32
PHS-NIOSH-210-76-0120

Worker exposure to mineral wool fibers and total airborne and respirable particulate material was determined from air samples at the U.S. Gypsum Corporation (SIC-3275) in Birmingham, Alabama, from October 25 to 29, 1976. The facility employed approximately 92 persons. First aid was given by supervisors. Pre-employment physical examinations were given before initial employment and after substantial lay-off periods, and examinations were given every 5 years to all employees and yearly to those over 60. The corporate headquarters administered the industrial hygiene and environmental control programs. No local safety or industrial hygiene program manager was employed at the facility. Protective equipment was provided for certain personnel. Housekeeping was a continuous problem. The equipment was old and needed constant attention to function. The concentrations of air contaminants were below NIOSH limits. Chargers, cupola operators, front-end leaders and battline take-off workers were exposed to the highest concentrations of airborne particulates. The author concludes that cupola operators were exposed to the highest combined overall concentrations of airborne fibers and total airborne particulate material.

Health Hazard Evaluation Report No. HE-79-80, 81-746, at Cobe Laboratories, Inc., Lakewood and Arvada, Colorado,
Dawn Gilles Tharr, and Michael Donnohue. Sep 80, 25p Rept no. NIOSH-HE-79-80

Environmental and personal samples were analyzed for isopropyl-alcohol (67630), cyclohexanone (108941), tetrahydrofuran (109999) (THF), toluene (108883), methyl-ethyl-ketone (78933) (MEK), ethylene-oxide (75218), Freon-12 (75718), toluene-diisocyanate (26471625) (TDI), methylene-chloride (75092), ethylene-dichloride (107062), perchloro-ethylene (127184), and methylene-bisphenyl-isocyanate (101688) (MDI) at Cobe Laboratories, Incorporated (SIC-3840) in Lakewood and Arvada, Colorado, from August 13 to 15, 1979. Medical questionnaires were administered to 140 workers. The evaluation was requested by individual employees on behalf of an unspecified number of affected workers. Measured concentrations of isopropyl alcohol, cyclohexanone, THF, toluene, MEK, ethylene-oxide, and Freon-12 were undetectable. Environmental samples collected for methylene-chloride revealed concentrations ranging from 15 to 187 parts per million (ppm) compared with the OSHA recommended standard of 500ppm. Ethylene-dichloride concentrations ranged from 1.5 to 3.2ppm, well below the OSHA standard of 50ppm. Perchloroethylene concentrations ranged from 7 to 29ppm, compared to the OSHA standard of 100ppm. Assembly line workers reported respiratory difficulties, but no significant incidence of eye or skin irritation, tumors, anemia, or neurologic problems was noted. The authors conclude that a potential health hazard exists from exposures to methylene-chloride, ethylene-dichloride, and possibly perchloro-ethylene. Recommendations include employee training, ventilation improvements, and medical monitoring of exposed workers.

Health Hazard Evaluation Report No. HE-79-14-760 at General Electric Company, Evendale,Ohio,
John R. Kominsky, Theodore Thoburn, and Mitchell Singal. Oct 80, 12p NIOSH-HE-79-14-760

Worker exposures to metallic vanadium (7440622) and airborne particulates were investigated at the General Electric Company (SIC-3510) in Evendale, Ohio, on January 25 and May 22, 1979, in response to a request from an authorized representative of the United Automobile Workers International Union, Local 647. Thirteen personal air samples were collected in the jet engine fan blade finishing area where approximately 88 workers were employed in two shifts. None of the samples contained vanadium in excess of the OSHA 1.0 milligram per cubic meter (mg/cu m) standard. The maximum 8 hour time weighted average (TWA) exposure to vanadium was 0.097 mg/cu m. Total particulate concentration in the outside shroud area was 16.8 mg/cu m, in excess of the 15.0 mg/cu m OSHA standard. Hearing loss, nose bleeds, sinus problems, headaches, nose irritations, bronchitis, and shortness of breath were reported by 14 of 27 interviewed workers. The authors conclude that outside shroud area workers were exposed to harmful particulate concentrations. They recommend protective equipment for workers in areas with particulate concentrations in excess of 15.0 mg/cu m and at fan polishing work sites. Ventilation should be inspected periodically.

Prevention of Low Back Injury in the Industrial Work Force: Symposium Held at Cincinnati, Ohio on November 9, 1972,
Donald W. Badger, Francis N. Dukes-Dobos, and Donald B. Chaffin. 9 Nov 72, 11p
Prepared in cooperation with Michigan Univ., Ann Arbor. Dept. of Industrial and Operations Engineering.

The proceedings of NIOSH sponsored symposium on the prevention of low back injury (LBI) in the industrial workforce are summarized. Clinical and scientific studies on LBI are described, including research on diagnostic and treatment procedures, screening methods and models of the musculoskeletal system. The authors recommend an intensive, coordinated research program to provide information on effective ways to reduce the incidence of LBI. Tests should be developed to objectively assess employee strength and health, and studies are needed on the relationship between work practices and the incidence and severity of LBI on spinal column aging. Workplace engineering and psychosocial factors affecting LBI also should be investigated.

Men's Apparel Industrywide Study: Fechheimer Bros. Co., Cincinnati, Ohio.
Industrywide study,
Peter J. Nord. 19 Sep 74, 6p IWS-46.14

Hazards associated with the men's apparel industry were surveyed in April 2, 1974, at Fechheimer Brothers Company (SIC-2311) in Cincinnati, Ohio. The company employed 200 workers. Medical services were provided by one woman trained in first aid. Materials used were wool and wool blends. Ventilation was provided by an air conditioning system. Sewing machines were equipped with needle guards. A hot wire process was used to seal the plastic film employed for wrapping pants. The general noise level was 68 to 70 decibels, and general area lighting levels were 125 foot candles. No dust measurements were taken, however, the work areas appeared clean and relatively dust free. The author recommends characterization of thermal decomposition products generated during the hot wire sealing process.

Development of Automatic Inflation Devices for Life Preservers.
Final rept.,
Jules Z. Lewyckyj. 31 Jul 81, 217p Rept no. NADC-81226-60

This historical description covers the various commands and countries involved in development of automatic inflation devices (with a manual override) that would inflate a life preserver automatically on water contact when the wearer enters the water and is incapable of manually inflating his preserver. These developments began when a number of military personnel involved in deck and ejection seat aircraft operations at sea became convinced that a disabled person, wearing a life preserver, might have a much better chance of survival if the life preserver inflated automatically after the wearer was in the water.

Carbon Dioxide Absorption Characteristics of High Performance Sodasorb at 1 Atmosphere.
Technical Memo. FY 1980-81,
A. Purer, G. A. Deason, M. L. Nuckols, and J. F. Wattenbarger. Oct 81, 22p NCSC-TM-327-81, SBIE-AD-F200 014

Standardized methods have been developed to evaluate the efficiency of different carbon dioxide absorbents. Effects of moisture, absorbent cell dimensions, linear velocity, and temperature have been included in this investigation. The use of such standardized procedures will allow data comparisons which have not been possible. The engineering data should also be directly applicable to future canister design.

Testing of RPMI-1640 as a Nutrient Medium for Fresh Semilunar Valve Storage.
James Beverly Nichols. 1979, 75p Rept no. AFIT-CI-79-302T-S

RPMI 1640 medium was evaluated for heart valve storage. Valves from 16 dogs were placed in the medium. The pulmonic valves were removed from the medium at 15 to 135 days and tested for viability by histopathology and the aortic valves were surgically implanted in recipient dogs for 81 to 85 days. At the end of that period of time, the dogs underwent cardia catheterization, afterwards euthanitized and the valves harvested for histopathological study. (Author)

Department of Health and Human Services, Washington, DC.
Method for Continuous Ambulatory Peritoneal Dialysis.
Patent,
Robert P. Popovich, and Jack W. Moncrief. Filed 4 Aug 78, patented 16 Dec 80, 9p PB82-137217, PAT-APPL-931 098
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 $0.50.

A process for the removal of toxins from the body in a continuous manner while the patient is totally ambulatory. The process involves the infusion of a dialysate fluid under prescribed conditions into the peritoneal cavity. The toxic solutes are transported across the peritoneum membrane into the dialysate fluid by the natural processes of diffusion and convection. The dialysate fluid and the toxins are then removed after a prescribed residence phase. Apparatus includes an indwelling balloon catheter surgically implanted within

the peritoneal cavity of a patient, a dacron cuff surgically attached to the abdominal wall, and an external quick connect coupling attached to the catheter. Apparatus may also include a wearable microbiological filter unit for reducing the risk of peritonitis during infusion of dialysate fluid.

See also Volume 2, PB82-141839. Prepared in cooperation with the Emergency Care Research Inst., Plymouth Meeting, PA.
Also available in set of 3 reports PC E15, PB82-141813.

This document is one part of a three-part report profiling the medical technology industry using an industrial organization (I.O.) economics approach and secondary data sources. Appendix A provides an analysis of the adequacy and availability of the various aggregated, firm specific, and specialized data bases. Collectively the documents contribute to the identification of influences affecting innovation and the description of what has happened to firms entering or exiting the market and factors associated with survival. The application of the industrial organizational methodology was tested in a case study of the cardiac pacemaker industry. The limitations of using existing secondary data sources for such analyses are discussed in detail.

Approved Prescription Drug Products with Therapeutic Equivalence Evaluations.
Data file,
Gary C. Collins, and Delores D. Willis. 1981, mag tape FDA/DF-81/004
Source tape is in EBCDIC character set. Tapes can be prepared in most standard 7 or 9 track recording modes for one-half inch tape. Identify recording mode desired by specifying character set, track, density, and parity. Call NTIS Computer Products if you have questions.

This data file was created to allow computer processing of data from the Approved Prescription Drug Products with Therapeutic Equivalence Evaluations (APDP). Each record contains the information required to identify a particular drug product. Other information regarding conventions and use of the data is contained in the preface to the APDP. To facilitate processing, there is some duplication of information among records so that each record contains all identifying information. In addition, for each record one NDA or ANDA number is included although more than one may apply to the particular drug product identified. The possibility of multiple numbers exists because the applicant may have more than one NDA or ANDA approved for the same drug product within the context of the data in the APDP. The distinguishing information may be package size, excipients, distributors, etc.

Behavioral Pharmacology of Human Drug Dependence.
Research mono.,
Travis Thompson, and Chris E. Johanson. Jul 81, 308p DHHS/PUB/ADM-81-1137, NIDR/DR-81-05
Also pub. as National Institute on Drug Abuse Research Mono. 37.

A review of the contributions of research on behavioral mechanisms of drug dependence, to interpret the relation of animal and human behavioral pharmacology findings to prevention of human drug dependence. The monograph brings together concepts from clinical and behavioral pharmacology and seeks the common processes underlying various forms of substance abuse. It describes effects of personality and the individual's history of drug exposure upon drug self-administration and discusses control of drug-related behavior by external and internal stimuli. Other sections deal with commonalities and differences among reinforcers and the maintenance of drug dependence by complex second-order schedules, in which drug-using behavior

is maintained by environmental stimuli only remotely linked with drug administration. Intended readership includes clinicians, researchers, pharmacologists, and others interested in behavioral analysis and treatment of drug dependence.

Benzodiazepines: A Review of Research Results, 1980.
Research mono.,
Stephen I. Szara, and Jacqueline P. Lundford. Nov 81, 112p DHHS/PUB/ADM-81-1052, NIDR/DR-81-06
Also pub. as National Inst. on Drug Abuse Research mono. 33. Report of the RAUS (Research Analysis and Utilization System) Review Conference on Benzodiazepines held September 12, 1980, Rockville, Maryland.

Benzodiazepines, the so-called 'minor tranquilizer' drugs, are very widely prescribed and used. The discovery of specific binding sites in the brain (1977) has made research on benzodiazepine receptors and their relation with neurotransmitter mechanisms a most active area of psychopharmacology. In addition, public interest in abuse potential and dependence liability of benzodiazepines is high. This monograph is based on a RAUS (Research Analysis and Utilization System) Review Conference held September 12, 1980. RAUS each year selects certain subject areas for intensive review, collects findings of all relevant intramural and extramural research supported by the National Institute on Drug Abuse, has them evaluated by scientific peers, then holds evaluative meetings to discuss findings and develop specific recommendations for future research. Subjects covered in this monograph include: basic biochemistry and neuroanatomy underlying the question of abuse potential of benzodiazepines, including the existence and sites of receptors involved; studies on self-administration in animals and humans; carryover effectiveness, rebound insomnia, and performance effects; clinical use patterns; misuse, abuse, and dependence.

Isometric, Isotonic, and Isokinetic Torque Variations in Four Muscle Groups through a Range of Joint Motion,
Joseph J. Knapik, James E. Wright, Roberta H. Mawdsley, and Joanne Braun. 4 Sep 81, 38p Rept no. USARIEM-M-2/82

This investigation described and examined variations in maximal torque production in knee extension, knee flexion, elbow extension, and elbow flexion through a range of joint motion. Subjects were young, healthy male (N = 16) and female (N = 15) soldiers. For all muscle groups torque was measured during maximal voluntary isometric and isokinetic contractions using a modified Cybex apparatus. Isotonic torque was calculated from a one repetition maximum using a modified N-K device. Joint angle curves were constructed for both genders and for each of the four muscle groups. Variations in torque were explained in terms of mechanical characteristics of the musculoskeletal system. Maximal capability of the muscle groups and external loading demands were discussed. The shift in peak torque with increasing velocity of isokinetic contraction was attributed to certain time requirements of the movement. Torque was found to decrease with increasing velocity of contraction. (Author)

Neurotransmitter Mechanisms in the Nucleus Accumbens Septi and Related Regions in the Rat Brain.
Rept. for 1976-1979,
Ivar Walaas. 30 Jun 81, 113p Rept no. NDRE/PUBL-81/1001

The present investigation compares the localization of different transmitter candidates, particularly the amino acids gamma-aminobutyrate (GABA) and glutamate (GLU), in limbic and basal ganglia regions in the rat brain. In particular, the characteristics of nucleus accumbens septi have been studied in some detail. GABA neurons have been found in nucleus accumbens, and GABA projections from this nucleus have been identified in restricted basal forebrain and mesencephalic regions. GLU projections from the neo- or allocortex have been found to terminate in nucleus accumbens and other forebrain and hypothalamic nuclei. Neurotransmitters in local neurons have been identified in the hippocampus, nucleus accumbens, septum and caudatoputamen by means of local kainic acid injections, while neurons in the mediobasal hypothalamus have been studied after systemic treatment of newborn animals with monosodium glutamate. The results are discussed as a basis for a better understanding of limbic-basal ganglia interactions.

Dopamine Depletion Slows Retinal Transmission.
Journal article,
Robert S. Dyer, William E. Howell, and Robert C. MacPhail. Sep 81, 17p EPA-600/J-80-014
Pub. in Experimental Neurology 71, p326-340 1981.

In male hooded rats, depletion of norepinephrine and dopamine by a-methyl-paratyrosine (AMT) significantly increased the latencies of early peaks in flash-evoked potentials recorded from the visual cortex, lateral geniculate nucleus, and optic tract. These effects were not produced by depletion of norepinephrine by FLA-63, blockade of muscarinic acetylcholine receptors by scopolamine, or blockade of opiate receptors by naloxone. AMT effects occurred only when flashes were used; optic tract stimulation failed to reveal the drug-induced changes. In a dose-response study, haloperidol produced effects similar to those of AMT. L-Dopa + R04-4602 reversed some of the effects of AMT. It is concluded that depletion of retinal dopamine impairs the timing of retinal responses to light.

Effectiveness of Five Water-Cooled Undergarments in Reducing Heat Stress of Vehicle Crewmen Operating in a Hot Wet or Hot Dry Environment.
Technical rept.,
George F.Fonseca. Mar 81, 50p Rept no. USARIEM-T-2/81

The auxiliary cooling provided by five water-cooled undergarments was directly measured on a life-size, sectional manikin. Each water-cooled undergarment was worn with a combat vehicle crewman (CVC) ensemble, with or without a complete chemical protective (CB) suit. Cooling rates (watts) were determined for both dry (non-sweating) and completely wet (maximal sweating) skin conditions. The watts of heat removed from either the dry or the completely wet skin surface were found to be almost directly proportional to the temperature difference between the manikin skin temperature and the cooling water inlet temperature; the cooling represents the absorption of heat directly from the body, plus any heat that is received by the body from a hot environment. The cooling density, expressed in watts of cooling per square meter of cooling tube array, differed with the size of the array and with the location of the skin surface it covered. Comparison between the dry skin and the completely wet skin surface and the completely wet skin cooling rates showed a synergistic effect over those areas covered by a water-cooled undergarment; i.e. the total watts of cooling over a completely wet skin area (head, torso, etc.) minus the expected evaporative heat loss from the same skin area to the environment, were considerably greater than the watts of cooling when the skin was dry. (Author)

Protection Factors of the Airstream Helmet.
Rept. of investigations,
Andrew B. Cecala, Jon C. Volkwein, Edward D. Thimons, and Charles W. Urban. Oct 81, 23p BUMINES-RI-8591

The Bureau of Mines conducted laboratory and in-mine tests on the Racal airstream helmet (Model AH21) to evaluate its protection efficiency. Laboratory tests indicated that as ambient air velocity increased, the protection offered by the helmet decreased. In tests conducted at several coal mine longwall sections with face velocities under 400 fpm, the helmet was 84 pct effective at reducing respirable dust in the miner's breathing zone. However, at a high-velocity section, 1,200 fpm, the efficiency of the helmet was significantly reduced, confirming our laboratory results.

Proceedings of a Workshop on the Protection of Personnel against Radiofrequency Electromagnetic Radiation Held at the Royal Air Force Establishment, Farnborough, United Kingdom, 6-8 April 1981.
Technical rept.,
John C. Mitchell. Sep 81, 250p Rept nos. SAM-TR-81-28, SAM-REVIEW-3-81

These are the proceedings of a workshop convened to address new developments in the setting and application of RFR safety standards, assessment of RFR levels in the military environment, RFR instrumentation and dosimetry, the medical approach to specific problems, and important state-of-the-art research regarding the biological effects of long-term, low-level RFR exposures, pulsed versus continuous wave effects, and the effects of unique pulse modulations. The collected papers represent the contributions of various experts in the field from the NATO countries, brought together under the sponsorship of Research Study Group 2, Panel VIII, Defence Research Group, NATO, at the Royal Air Force Institute of Aviation Medicine, Royal Aircraft Establishment, Farnborough, U.K., 6-8 April 1981. CRRIS: A Computerized Radiological Risk-Investigation System.
C. F. Baes, III, and C. W. Miller. 1981, 11p CONF-810905-10
Contract W-7405-ENG-26
ANS/ENS topical meeting on probabilistic risk assessment, Post Chester, NY, USA, 20 Sep 1981.

The US Environmental Protection Agency (EPA) is responsible for regulating radioactive airborne effluents in the US. A comprehensive, integrated Computerized Radiological Risk Investigation System (CRRIS) is being developed to support EPA's radiation standards development. This modular system consists primarily of five computer codes and their supporting data bases for estimating environmental transport and radiation doses and risks. Health effects are estimated on the basis of a life-table methodology developed by EPA. CRRIS is designed to provide EPA with a reasonable and flexible way of assessing the risk to man associated with radionuclide releases to the atmosphere. (ERA citation 06:035496)

Spermatogonial Stem Cell Renewal Following Irradiation.
J. I. Fabrikant. May 79, 11p CONF-790524-13
Contract W-7405-ENG-48
International congress symposium on radiation research and stem cells, Tokyo, Japan, 13 May 1979.

The spermatogonial cell renewal system can maintain function and a steady level of cell population for relatively long periods of continuous low-level irradiation indicating that there does not appear to be a serious accumulation, over many generations, of damage affecting proliferation. Provided the dose-rate is quite low, there is an effective selective removal of damaged cells with almost complete repair of cellular nonlethal damage. At dose-rates greater than 2 rad/day, spermatogonia are very sensitive to radiation death, and the main reason for the low tolerance to continuous stress could, in part, be the limited extent of compensatory mechanisms regulating spermatogonial cell production. However, there is some capacity to change the patterns of cellular proliferation while still remaining under homeostatic control, and this capacity appears to reside in the relatively radioresistant A/sub s/ stem-cell population. Little is known about the extent to which the spermatogonial cell population can repair nonlethal cellular radiation damage accumulated under continuous stress affecting the regenerative capacity of the tissue. After acute exposure, a minimum number of surviving type A/sub s/ stem-cells are required to repopulate the functional seminiferous epithelium, regeneration proceeds along an ordered cell stage sequence, and is dependent on the time required for all stages from type A/sub s/ spermatogonia to mature spermatozoa. Under continuous irradiation, provided the dose-rate is not too high, the repopulating ability of the seminiferous epithelium is maintained, in the presence of injury, due to initial repair and long-term repair of cellular radiation damage. There is evidence for initial repair, since a dose-rate effect exists in type A survival, at low doses. Long-term repair occurs due to differential radiosensitivities of spermatogonia. Baseline Study of Effects of Ionizing Radiation on the Chromosomes of the Marine Worm, 'Neanthes arenaceodentata'.
Technical note,
Gerald G. Pesch, and James S. Young. Sep 81, 19p ORP/SEPD-81-1
Also pub. as Environmental Research Lab., Narragansett, RI. Contrib. no. 198.

Between 1946 and 1970 the United States disposed of low level radioactive waste at several sites in the Atlantic and Pacific Ocean. In 1972 the Environmental Protection Agency was authorized under the Marine Protection Research and Sanctuaries Act (PL-92-532) to regulate all ocean disposal activities. This Act requires EPA to establish a program for reviewing and evaluating ocean dumping permit applications. Before EPA can approve permits for ocean dumping of radioactive waste, it will be necessary to determine how such wastes may affect marine biota. The purpose of this study was to test the feasibility of using a marine coastal worm, Neanthes arenaceodentata, as a cytogenetic model for assessing radiation damage to ocean organisms. Groups of worms were exposed to cobalt-60, then slide preparations were made and scored for gross chromosome aberrations and damage. All the levels of ionizing radiation tested from 180-680 rads were found to cause significant chromosome damage in N. arenaceodentata. The nature of this damage depended on dose, dose-rate and DNA repair capability of the worm. Worms responded to the same dose range as do mice. Since mice are accepted models for studying radiation effects on humans, this study supports the utility of using this species to study radiation effects on marine organisms.

When the Grand Tour's a Grind,
Stanley C. Knapp. Sep 81, 14p Rept no. USAARL-81-2

Americans are traveling more and, in the view of many observers, enjoying it less. Modern jet travel, along with the necessity or desire to see as many tourist sights or conduct as many business meetings as possible in a single day, serve to create a well-defined but often overlooked symptom complex called travel stress. Travel stress is the complex interaction of a number of environmental, physiological, and psychological stressors. Disruptions in the traveler's circadian rhythm, changes in dietary habits, noise, vibration, pattern changes in the use of stimulants and alcohol, and the pressure of trying to get the most for one's travel dollar impact the health and efficiency of the traveler. This paper outlines proven and practical pre-travel prevention techniques and en route therapy. (Author)

Male Wistar rates were kept hypokinetic by placing them in small containers for 22 days. Blood plasma cAMP content was subsequently found increased, and cGMP content decreased, in the experimental animals. Liver and thymus cAMP content was similar in the control and experimental animals. There was a 20 and 38% decrease of cAMP content in the kidneys and spleen, respectively. Hypokinesia's reduction of cyclic nucleotides seems to inhibit RNA and protein synthesis.

Studies of the gastrocnemius muscle were carried out in 4 month old cockerels of the laying hybrid after hypokinesis lasting 15 and 30 days. It was found that restricted movement resulted in dystrophic changes of myotibrils, enlargement of the sarcoplasmic reticulum and oedem of interfibrillar spaces. Histochemical studies revealed focuses of increased activity of non-specific esterase, decreased activity of dehydrogenase of lactic acid and a positive reaction of acid phosphatase.

Thrombin marked with I-131 resulted in a considerable increase of the thrombined clearance rate in healthy male rats during stress caused by an immobilization lasting 30 minutes, and in an increase of thrombin clearance occurred by a combination of immobilization and administration of adrenocorticotropin (ACTH). Contrary to ACTH, the thrombin clearance is not stimulated in healthy animals by hydrocortisone. The results of the examination are presented.

Effects of Curative Treatment Emphasizing Endurance Training on the Performance and Blood Pressure of Hypertensive and Normotensives.
F. Worms. Jun 81, 20p NASA-TM-76520
Contract NASW-3199
Transl. Into English from Dtsche. Gesundheitswesen, V. 35, No. 31, 1980 p 1207-1212. Transl. By Kanner (Leo) Associates, Redwood City, Calif.

The problem of normal values of blood pressure after exercise taking into account the blood pressure at the end of the exercise test is discussed. Hypertensives showed a lower working capacity than normotensives. In normotensives, however, systolic blood pressure at the end of an exercise correlated well with the working capacity. After the endurance cure submaximal blood pressure was markedly lower in hypertensives with a striking dependence on the level of initial values. Systolic blood pressure at the end of an exercise test was not changed significantly. Most probably it is not possible to overcome this malregulation in hypertensives by endurance training alone.

Monitoring Calcium in Trout Eggs Exposed to Hydrazine.
Final rept. 1 Feb-1 Aug 81,
Vernon Henderson. 10 Jul 81, 33p AFOSR-TR-81-0654
Grant AFOSR-81-0079

This study was designed to determine if certain hydrazine-induced morphological abnormalities could be attributed to reduced levels of available calcium. Rainbow trout eggs (Salmo gairdneri) were exposed to 48 hours to 1.0, 2.0, 4.0, 6.0, and 8.0 mg/l of hydrazine. The responses to these concentrations were dose related. Eggs exposed to low concentration were less affected than those exposed to high concentration. Utilizing several staining techniques in combination with SEM, TEM and microelemental analysis, control muscle tissue showed a higher calcium level than healthy muscle of the 8.0 mg/l hydrazine treated group. Maldeveloped muscle of the 8.0 mg/l group showed a higher level of calcium than healthy muscle of the same individual. The notochord of the 8.0 mg/l group showed a higher calcium level than the control group. The chorion did not reveal a calcium level although structural modifications occurred in the treated groups which resulted in a softening. (Author)

Studies have been conducted to define quantitative analytical methods for the determination of various munition compounds in biological matrices. The munition compounds evaluated included cyclotrimethylenetrinitramine (RDX), dinitrotoluene (DNT), trinitrotoluene (TNT), pentaerythrite tetranitrate (PETN), and 2, 4, 6-trinitrophenylmethylnitramine (tetryl). The biological matrices selected for study were animal plasma, kidney, muscle/fat, and liver and plant leaves and stems. The analytical methods were to be able to detect and quantitate the munition compounds at the 100 ng/g (parts per billion) level and were designed to utilize readily available analytical instrumentation, to be able to analyze a number of samples in a routine manner, and to be capable of providing the final results in a relatively short time. The developed methods may have application in assessing the environmental contamination of these munitions in the plants and animals at munition production facilities or in the immediate area. This report describes the research effort to develop the analytical methods for munition compounds in biological matrices.

Review of Short-Term Screening Tests for Mutagens, Toxigens, and Carcinogens.
H. J. Carney, and B. S. Hass. Jul 79, 67p
Contract W-31-109-ENG-38

In order to test the thousands of man-made chemicals in the environment for carcinogenic and genetic hazards, a multitude of short-term screening tests has been developed to complement long-term mammalian bioassays and epidemiological studies. These tests cover a broad spectrum of organisms, and include the use of naked and viral nucleic acids, bacteria, fungi, higher plants, insects in vitro mammalian cell cultures (cell transformation, cell-mediated mutagenesis, DNA repair, and chromosome aberration tests) and live mammals. Assay end points include effects on nucleic acids, DNA repair synthesis, point or gene mutation, structural and numerical chromosome aberrations, cytological alterations, and in vitro cell transformation. The present review describes and compares these

assays. In addition, it discusses their historical development, the problems and limitations associated with their use, and their implementation in comprehensive testing programs. It is intended to provide overview and specific information to the laboratory that is in the process of establishing genetic toxicological systems. (The literature is reviewed to January 1978.). Study of Protein Modifications Induced by Phorbol Ester Tumor Promoters in Mouse Skin.
K. G. Nelson. Aug 81, 104p DOE/TIC-11494
Contract AC05-76OR00033
Thesis. Submitted to the Univ. of Tennessee, Knoxville, TN.

The purpose of this study was to determine if the phorbol ester tumor promoter 12-0-tetradecanoylphorbol-13-acetate (TPA) induced any specific changes in mouse epidermal proteins using the high resolution technique of two-dimensional electrophoresis. To accomplish this goal of determining the specificity and possibly the stage in promotion with which these protein changes were associated, epidermal proteins were analyzed (1) after treatment of adult mouse epidermis with several weakly promoting hyperplasiogenic agents, (2) following treatment with TPA in combination with various inhibitors of tumor promotion, (3) in basal kerotinocytes isolated from adult epidermis following treatment with TPA or several weakly promoting agents, and (4) during an initiation-promotion experiment. Evidence was found which indicated that the potent tumor promoter TPA as well as the weakly promoting hyperplasiogenic agents, mezerein, ethylphenylpropiolate (EPP), and mechanical abrasion, induced similar modifications of epidermal proteins, particularly among the keratins. These keratin modifications progressed with time following treatment resulting in a keratin pattern which resembled that of newborn epidermis. (ERA citation 06:035519)

Review of Open Literature on Effects of Chlorine on Aquatic Organisms.
D. M. Opresko. Aug 80, 320p EPRI-EA-1491
Contract W-7405-ENG-26

The pre-1980 open literature on the chemistry and biological effects of chlorine in marine, freshwater, and estuarine systems is reviewed with special emphasis placed on the potential impacts of power plant chlorination practices. Information is provided on aqueous chlorine chemistry including the types and relative concentrations of residual oxidants formed under varying environmental conditions; the stability, persistence, and reactivity of these oxidants; and their potential for forming halogenated organic compounds. Analytical methods for differentiating and measuring chlorine-produced residual oxidants are discussed in a separate section. Information on biological effects, derived mainly from the results of laboratory bioassays, consists primarily of acute toxicity data, but also included are discussions of biological and environmental factors affecting species' tolerance levels; sublethal effects on reproduction, growth, behavior, and physiological processes such as respiration and osmoregulation; and possible mechanisms of oxidant toxicity at the cellular or biochemical level. The final chapter considers the relative efficiency and potential environmental impact of alternative chemical and physical methods for controlling biofouling in power plant cooling systems. (ERA citation 06:035521)

Acclimation Temperature: An Important Factor Influencing the Interaction of Chlorine, delta T and Exposure Duration to Eggs, Prolarvae and Larvae of Striped Bass, 'Morone saxatilis',
Lenwood W. Hall, Jr., Stuart L. Margrey, and William C. Graves. Aug 81, 53p PPSP/PPRP-47

The effect of five acclimation temperatures on the interactions of total residual chlorine (TRC) (0.00, 0.15 and 0.30 mg/liter), delta T (2, 6, 10 C) and exposure duration (0.08, 2.0, 4.0 hours) conditions were evaluated for striped bass, Morone saxatilis, eggs, prolarvae and larvae. The range of acclimation temperatures (12.5, 15.0, 17.5, 20.0, 22.5 C for eggs and prolarvae; 15.0, 17.5, 20.0, 22.5 and 25.0 C for larvae) tested with each life stage included the lower, optimum and upper environmental temperatures that exist when these life stages may be subjected to power plant chlorination conditions. All organisms were tested using a fractional composite design in a 3 x 3 x 3 factorial matrix. Mortality of the eggs was highest at temperatures below 17.5 C; overall mortality decreased with increasing acclimation temperature. The factor causing the greatest effect with this developmental stage was T, followed by TRC and exposure time. Mortality of striped bass prolarvae increased with acclimation temperature after exposure to interacting treatment factors. Interactions involving TRC were most important from 12.5 to 17.5 C; delta T interactions were prominent at acclimation temperatures of 20.0 and 22.5 C. Larvae mortality was highest at 20 C with a gradual decrease at 25.0 C. Interactions involving delta T, TRC and exposure time all contributed to the mortality of this life stage; TRC and delta T caused the main effects. Striped bass eggs were the most resistent life stage; mean mortality averaged over all acclimation temperatures was approximately the same for prolarvae and larvae.

Effect of Fluctuating Exposures on the Acute Toxicity of Ammonia to Rainbow Trout (Salmo gairdneri) and Cutthroat Trout (S. clarki).
Journal article,
Robert V. Thurston, Charles Chakoumakos, and Rosemarie C. Russo. Oct 81, 7p EPA-600/J-81-345
Pub. in Water Research, v15 p911-917 1981.

Acute toxicity bioassays in which fish were exposed to short-term cyclic fluctuations of ammonia were conducted on rainbow trout (Salmo gairdneri) and on cutthroat trout (S. clarki). Companion tests were also conducted in which test fish were subjected to ammonia at constant concentrations. The tests ranged in duration from 96 h to 4 weeks. Median lethal concentration (LC50) values in terms of both average and peak concentrations of ammonia for the fluctuating concentration tests were compared with LC50 values for the constant concentration (conventional) tests. Based on comparisons of total dose exposure, results showed that fish were more tolerant of constant concentrations of ammonia than of fluctuating concentrations. Fish subjected to fluctuating concentrations of ammonia at levels below those acutely toxic were subsequently better able to withstand exposure to higher fluctuating concentrations that fish not previously so acclimated.

Initial Toxicological Assessment of Ambush, Bolero, Bux, Dursban, Fentrifanil, Larvin, and Pydrin: Static Acute Toxicity Tests with Selected Estuarine Algae, Invertebrates, and Fish.
Rept. for May 79-Aug 81,
Patrick W. Borthwick, and Gerald E. Walsh. Sep 81, 13p EPA-600/4-81-076

Selected static toxicity tests were conducted with Ambush, Bolero, Bux, Dursban, Fentrifanil, Larvin, and Pydrin to determine the sensitivity of species representing four major phyla. Algal bioassays were conducted with marine algae to determine the concentration of pesticide that would inhibit population growth by 50% in 96 h. Static toxicity tests with mollusk larvae estimated the concentration of pesticide that would cause 50% of the exposed larvae to develop abnormally in 48 h. Static acute lethality tests with crustaceans and fish determined the concentration of pesticide that is lethal to 50% of the test organisms during a 96-h exposure.

Fuel Gas Demonstration Plant Program: Small-Scale Industrial Project. Demonstration Plant Design Manual, Phase I.
Jan 79, 594p
Contracts ET-78-C-01-2578, EW-78-C-02-5066

The plant will utilize fixed bed, stirred, two stage gasifiers. The lower stage will be a standard gasifier configuration. The upper stage will be an undivided distillation section containing a slowly rotating stirrer which will move vertically through the bed. The bottom of the gasifier will contain a standard dry grate and will have lock hoppers to discharge the ash. This type of gasifier provides high coal utilization. It also distills the tars and oils from the coal in the upper zone at minimum temperatures, thereby providing minimum viscosity liquid fuels which can be used for the induration of iron ore pellets. The very hot bottom gases leaving the combustion zone, after passing through a cyclone to remove coal and ash dust can be used to generate steam. This steam is in addition to the steam generated in the water jacket of the lower zone which is used in the steam air blast to the bottom of the gasifier retort. (ERA citation 05:019918)

Solvent-Refined Coal (SRC) Process. Final Report.
Aug 81, 87p DOE/ET/10104-12
Contract AC05-76ET10104

In late 1979 the Pittsburg and Midway Coal Mining Co. (P and M), recommended to the Department of Energy (DOE) that certain areas of the SRC Pilot Plant should be modified to represent the SRC-II Demonstration Plant design. The proposed modifications were for design confirmation; start-up, transient and other operational guidance studies; and training of operator and professional personnel. The pilot plant facilities proposed for modification were: Coal Slurry Mixing - Area 01; Dissolver Effuent Cooling and Separation - Area 02; and Vacuum Flash/Residue Pump Testing - Area 04. A summary justification assessment for the modifications is included. A preliminary engineering study by Badger Energy, Inc. (BEI) was completed in late 1980. A proposal to begin detailed engineering had been submitted to DOE for approval when all work was discontinued at the direction of the DOE in April 1981. (ERA citation 06:034206)

Solvent Refined Coal Process: Operation of the Solvent Refined Coal Pilot Plant, Wilsonville, Alabama. First Quarter Report, January-March 1981.
H. E. Lewis. 1981, 142p DOE/ET/10154-T16, FE-2270-88
Contract AC22-76ET10154

This report summarizes the operating conditions and test results obtained during the first quarter of 1981 at the six ton per day solvent refined coal (SRC-I) pilot plant in Wilsonville, Alabama. The plant operated for

approximately two-thirds of the period with a scheduled shutdown, from 22 February to 17 March, accounting for most of the downtime. Kentucky 9 coal from the Fies mine was processed throughout the period. The following potential process improvements and tests were evaluated in the respective process units. SRC Unit: Low severity run tests to evaluate SRC reactor conditions for two-stage liquefaction; process solvent quality studies while simulating demonstration plant conditions with low quality process solvent (anthracene oil); operation of the new, reduced volume and residence time, V103 High Pressure Separator; Evaluation of the hot separator mode of operation; and adjustment of the T102 Vacuum Column operation to determine if it can produce a combined trays 3 and 8 stream that would be an acceptable process solvent (95% boiling at over 450 exp 0 F). CSD Unit: Steam stripping of SRC and LSRC to reduce product-related DAS losses; and ambient and cryogenic SRC sampling comparisons for DAS determination tests. Pressure checking of the hydrotreater unit was completed, and the Dowtherm system was placed in service. Solvent circulation was initiated in the unit as efforts continued to verify equipment performance. (ERA citation 06:034207)

Fixed-Bed Gasification.
Jan 81, 29p DOE/METC/SP-184

Since the completion of construction in 1967, the METC Gasifier Pilot Plant has produced data and demonstrated operation on all major ranks of US coals. In 1976, METC began an expansion program to include a novel gas-cleanup facility to evaluate the environmental problems associated with gasification plants and also to develop improved cleanup systems. The construction and checkout of this full-scale cleanup system was completed within the past year and the pilot-plant facility now has the capability of gasifying all US coals and producing a relatively tar-, oil-, particulate-, and sulfur-free fuel gas. The Department of Energy's (DOE) fixed-bed gasification development program includes other facilities that provide DOE with a broad capability to address alternative- and advanced-gasification technologies. In addition to utilizing these facilities to evaluate and improve gasification/cleanup-system configurations, the pilot plants are also being used to support a number of related projects. (ERA citation 06:034211)

EDS Coal-Liquefaction Process Development. Phase V. EDS Commercial Plant Study Design Update: Illinois Coal. Volume 2. Base Case.
W. R. Epperly. Mar 81, 435p FE-2893-61(V.2)
Contract AB01-77ET10069
U.S. Sales Only.

This report is Volume 2 - Base Case of the EDS Commercial Plant Study Design Update. The complete documentation (Executive Summary plus Volumes 1, 2 and 3) covers the conceptual, or study design of an Exxon Donor Solvent (EDS) Coal Liquefaction Commercial Plant feeding Illinois No. 6 bituminous coal. The EDS process directly converts coal to a range of clean hydrocarbon products by contacting the coal with hydrogen in the presence of a hydrogenated solvent at about 840 exp 0 F and 2000 psi. Potential process improvements conceived after the design basis was set in 1978, such as liquefaction bottoms recycle and direct combustion of liquefaction bottoms, are not reflected here. Entitled the Study Design Update (SDU), this conceptual design is a complete update of an earlier, less extensive study design prepared in 1975/1976. The SDU was started in 1977, and technical work was completed in 1979; about 245 engineer-months of effort were expended. The objectives of the SDU were to identify the technical issues facing a potential commercial-size EDS plant design, to provide a reliable basis for estimating the cost of EDS products, and to furnish research guidance to the EDS Project. Also, the SDU was to provide a firm starting point for initial commercialization studies of a future pioneer liquefaction plant. These objectives were achieved. Volume 2 of the EDS Commercial Plant Study Design Update report covers process details of the Base Case design (steam reforming for hydrogen/FLEXICOKING for fuel). Design information for each process block (e.g., liquefaction) is given in the individual attachments. Process flow schemes heat and material balances, and equipment specifications are included. (ERA citation 06:019629)

Contract AB01-77ET10069
U.S. Sales Only.

A simplified model for coal conversion is being formulated. In this new approach fewer model parameters were used while preliminary results showed correlation of the RCLU data base to be equally as good as the earlier model. A solvent hydrogenation simulation study is being conducted to support recommendations of hydrotreating conditions for ECLP which should result in an improvement in solvent quality. Preliminary results indicate that less severe solvent hydrotreating conditions will result in lower saturates production rates and be beneficial in improving solvent quality. EDS distillate will be tested as a rich/lean utility gas turbine fuel in an EPRI sponsored United Technologies program, and a combined liquid product from Big Brown lignite will be upgraded by Chevron in a DOE sponsored program. Seven-and-one-half tons of vacuum bottoms were loaded and shipped for grinding. This material will be used for testing at the Shell Partial Oxidation Pilot Plant in Amsterdam. Vacuum bottoms totaling 135 tons were shipped to Texaco in California for partial oxidation testing. Industrial Hygiene sampling is continuing in two particular areas: (1) monitoring of Mechanical personnel when they are performing maintenance on pumps; and (2) area sampling around the atmospheric bottoms pumps and the vacuum bottoms cooling belt. (ERA citation 06:023000)

A study to assess the feasibility of the EDS-FPU processing Illinois once through vacuum bottoms with higher-than-design quantities of flux to over-come feed circuit viscosity limitations was completed. As previously reported, the two flux levels studied (35% and 100% flux on vacuum bottoms) could be processed in the EDS-FPU without a reduction in the design vacuum bottoms rate by adjusting several operating conditions/modes (i.e., gasifier temperature, air to heater, recycle coking). Based on the current laboratory data for ECLP bottoms produced to date, 35% flux on vacuum bottoms should be sufficient to overcome viscosity limitations in the EDS-FPU feed circuit. Therefore, it was recommended that at this time no design changes to the EDS-FPU be made to accommodate 100% fluxing of Illinois once-through vacuum bottoms. ECLP and the ERE Laboratory at Baytown are continuing analyses of existing ECLP vacuum bottoms and will monitor present production daily for melting point and viscosity changes. The impact of these analyses on the results of this study will be reviewed as necessary. Work is continuing on the preparation of an expanded Design Basis Specification for the low Btu (LBG) cleanup facilities for the FLEXICOKING Prototype Unit (FPU). It has been verified that an existing amine scrubber tower at the FPU site has an adequate number of trays and is of the proper diameter to reduce contaminant concentrations to the desired levels in the LBG generated from any of the three FLEXICOKING operations described. A review of the existing EDS-FPU gasifier grid cap design has resulted in a modification of the grid cap. (ERA citation 06:023001)

Industrial Fuel Gas Demonstration Plant Program. Task II Report, Demonstration Plant Process Design. 2ND Issue.
Oct 79, 381p
Contract EF-77-C-01-2582

This Design Basis, initially issued March 4, 1979 forms the foundation for process and mechanical engineering of the demonstration plant. Included in the Basis of Design are the plant capacity, coal analysis, product gas specifications, unit material balance around the gasifiers, design parameters for various plant areas. This plant is designed to gasify coal and produce a clean medium Btu Industrial Fuel Gas (IFG). Sulfur in the coal is recovered and bright liquid sulfur produced. The plant is designed for a net IFG production of 50 x 10 exp 9 Btu/day. The plant is designed to produce only IFG and sulfur. No other by-products were considered in the Phase I demonstration plant design. The plant is designed for operation at a 90% on-stream factor, excluding credit generation. Sufficient spare equipment is provided to allow the plant to achieve the 90% factor. This includes, but is not limited to, rotating equipment; large centrifugal compressors may have spare rotors only. A distinction was made between equipment items with installed spares and items for which plot space is left vacant for a possible spare, to be installed if found necessary. The plant is designed to operate at a net IFG production of 15 x 10 exp 9 Btu/day through the Credit Generation System. The product gas specifications to the IFG pipeline was maintained at all levels of operation between 100% and 33-1/3% of the plant material balance. The plant

is designed to operate on the representative coal described. Other coals may be used in the plant in the future. The coal feed rate will then be adjusted to fit the capacities of the various units in the plant. (ERA citation 05:014665)

Contracts NAS7-100, DE-AI21-77ET-13032
Sponsored in Part by Doe and JPL.

A technical assessment of the following advanced coal gasification processes is presented: high throughput gasification (HTG) process; single stage high mass flux (HMF) processes; (CS/R) hydrogasification process; and the catalytic coal gasification (CCG) process. Each process is evaluated for its potential to produce synthetic natural gas from a bituminous coal. Key similarities, differences, strengths, weaknesses, and potential improvements to each process are identified. The HTG and the HMF gasifiers share similarities with respect to: short residence time (SRT), high throughput rate, slagging, and syngas as the initial raw product gas. The CS/R hydrogasifier is also SRT, but is nonslagging and produces a raw gas high in methane content. The CCG gasifier is a long residence time, catalytic, fluidbed reactor producing all of the raw product methane in the gasifier.

Application of the Method of Inequalities to the Multivariable Control of Binary Distillation Columns,
O. Taiwo. Jan 79, 36p CONTROL SYSTEMS CENTRE-442

The method of inequalities is used to design controllers for dual quality control of four binary distillation columns whose top and bottom compositions are controlled by manipulating reflux rate and steam. Two types of multi-variable proportional-plus-integral controllers are designed and the performance of the system with these controllers is compared with that of non-interacting control. The results of implementing the simpler controller, which is represented by a diagonal matrix, on a computer-controlled packed distillation column are also presented.

Contract EPA-68-01-3896
See also PB-266 181.

Study investigated the published literature for selected areas in three classes of plasticizers: epoxies, linear polyesters, and trimellitates. Areas of interest included physical and chemical properties, production and use, health and environmental effects, and plasticizer interchangeability. Current production methods, sites, and annual volumes are presented for each class. Little information is available in the published literature on health effects. No occupational standards exist for any of the three classes. Unpublished health data are available for selected tests from manufacturers for specific materials. Environmental effects were limited to static fish toxicity studies for two trimellitates and studies of fungal and bacterial growth with epoxies and linear polyesters. Both classes of plasticizers are very susceptible to fungal and bacterial attack.

Competitive Pathways in Chlorine Dioxide Oxidation of Amines: Amide Formation from Acyclic Amines.
Final rept. Oct 80-Sep 81,
Elizabeth P. Burrows, and David H. Rosenblatt. Oct 81, 12p Rept no. USAMBRDL-TR-8109

Treatment of dibenzylamine and ethyl N,N-dibenzylglycinate with chlorine dioxide ($C1O_2$) gave, in addition to the expected products of oxidative dealkylation, substantial amounts of amides. With the second reaction and preformed $C1O_2$ at pH 4-7, ethyl N,N-dibenzyloxamate was the predominant isomer; however, with $C1O_2$ generated in situ at pH 2.5-3, ethyl N-benzoyl-N-benzyl glycinate was predominant. In the latter case the combined yield of amides was sufficiently high (80%) to be of synthetic utility. (Author)

Pentamethylcyclopentadienyl Cobaltaboranes Derived from the $B5H8^{(-)}$ and $B9H14^{(-)}$ Ions: Studies in Synthesis and Structure.
Interim technical rept.,
T. Leon Venable, and Russell N. Grimes. Nov 81, 49p Rept no. TR-38
Contract N00014-75-C-0305

The reactions of of $B5H8^{(-)}$ and $B9H14^{(-)}$ ions (both generated from B5H9 and NaH in THF solution under different conditions) with CoCl2 and $Li^{(+)}(C5(CH3)5)^{(-)}$ in THF, were examined. The two reaction systems generate entirely different cobaltaborane products, which were isolated as air-stable, colored crystalline solids and characterized by B11 and H1FT NMR spectroscopy at 115.5 and 360 MHz, respectively, and by unit- and high-resolution mass spectrometry, infrared spectra, and (in five cases) by X-ray diffraction studies. From the $B9H14^{(-)}$ reaction four products were characterized, all of which are 10-vertex CoB9 or $Co2B8$ nido cages analogous to B10H14; the major species, 6-(C5(CH3)5)CoB9H13, was obtained in 25% yield. Minor products were 6,9-(C5(CH3)5)2Co2B8H12'5,7-(C5(CH3)5)2CoB8H12, and the 6-chloro derivative of the latter compound. The $B5H8^{(-)}$ reaction generates a larger and structurally more diverse series of products, none in greater than 5% yield. The major products obtained after a 2-hr reaction period at room temperature are 2-(C5(CH3)5)CoB4H8, 1,2-(C5(CH3)5)2Co2B4H6, and 1,2,3-(C5(CH3)5)3Co3B4H4 all of which are analogous to cyclopentadienyl complexes obtained in the reaction of $B5H8^{(-)}$ with CoCl2 and C5H5C5H--5 reported earlier.

Contract N00014-79-C-0525

Three general synthetic routes to the preparation of energetic oxetanes and tetrahydrofurans were investigated during the first year of the program. Subsequently, 3-(2-fluoro-2,2-dinitroethyl-3-methyloxetane (FOE) was prepared and polymerized to give oligomers with molecular weights ranging from 6,000 to 15,000. Efforts to develop a general synthetic route to 3-nitroalkyl substituted oxetanes starting with methylene malonate were not successful. However, work on an alternative general route to oxetanes afforded oxetane 3,3-diacetic acid in low yield This material could be used to prepare a series of nitro esters of oxetane, but this

work was terminated as our experience has shown that cationic polymerization of esters does not produce significant conversion of the monomer. Work on a general route to nitroalkyl-substituted tetrahydrofurans resulted in 3-(2,2-dinitropropyl)tetrahydrofuran (3-DNPTHF), which was prepared using a synthetic route of general applicability to other 3-substituted tetrahydrofurans. A preliminary polymerization study yielded dimer and trimer, suggesting that polymerization was possible.

Interim technical rept.,
James A. Bruce, and Mark S. Wrighton. 15 Sep 81, 48p Rept no. TR-30-ONR
Contract N00014-75-C-0880

Electrodes derivatized with electroactive polymers or with charged, nonelectroactive polymers can be significantly influenced by the nature of the electrolyte and other ions present in a solution contacted by the derivatized electrode. It has been shown that charged, nonelectroactive polymers can persistently bind significant quantities of charged, electroactive species such as Fe(CN)(6)(4-) by surface polyvinylpyridinium or Ru(bipyridine)(3)(2+) by Nafion. Theses examples illustrate how electrostatic binding may be exploited for anlaysis, preparation of a variety of modified electrodes, and study of electrocatalysis. Electroactive polymers are charged in at least one of their accessible redox states and both selectivity of counterion binding and the movement of ions in and out of the surface polymer associated with change of redox state may affect electrochemical behavior. Electrodes coated with electroactive polymers may have a number of uses, including desalting of H20, that depend on the behavior of solution ions.

The Nature of the Phase Transition Observed for Monolayers of Azulene on Pt(III).
Interim rept.,
David Dahlgren, and John C. Hemminger. 1 Oct 81, 16p Rept no. TR-2
Contract N00014-79-C-0648

A model is presented for the reversible phase transition observed for azulene monolayers on Pt(III). Below the transition temperature the overlayer LEED pattern consists of (3x3) aligned with the substrate and (3x3) rotated by 30 degrees. Above the transition temperature the LEED pattern is a (3x3) aligned with the substrate. The model attributes the phase transition to an order-disorder transition of the rotational orientation of azulene molecules with the molecular plane parallel to the surface. (Author)

Chemisorption and Thermal Chemistry of Azulene and Naphthalene Adsorbed on Pt(III).
Interim rept.,
David Dahlgren, and John C. Hemminger. 1 Oct 81, 35p Rept no. TR-3
Contract N00014-79-C-0648

The ordering phenomena and thermal chemistry of the isomeric aromatic hydrocarbons azulene and naphthalene have been studied on a Pt(III) surface. Complete dehydrogenation with an onset of about 200 C is the eventual fate of these molecules absorbed on Pt(III). Several ordered phases exist for azulene overlayers as a function of coverage. Azulene overlayers with C/Pt atom ratios in the range 1-1.3 exhibit a reversible transition with temperature. The orientational ordering of neighboring molecules appears to be governed by intermolecular forces rather than the molecule-Pt interaction in both azulene and naphthalene overlayers. (Author)

(13)C NMR of AsF5 Doped Polyacetylene.
Technical rept.,
T. C. Clarke, and J. C. Scott. 8 Sep 81, 11p Rept no. TR-7
Contract N00014-80-C-0779

Natural abundance C13 NMR experiments using cross polarization and magic angle spinning are reported for polyacetylene as a function of AsF5 doping level. In contrast with previous authors we find that the doping of cis-polyacetylene leads, even at low doping levels, to a new signal characteristic of the doped regions of the polymer. Similar measurements on trans-polyacetylene indicate that the doping of the trans isomer proceeds considerably more uniformly than that of the cis osomer. Comparisons with appropriate model compounds suggest that the observed shift of the C13 NMR signal on doping is primarily a chemical shift rather than a Knight shift. (Author)

Determination of Sodium Gluconate in Corrosion-Removing Compounds.
Rept. for Apr 80-Apr 81,
Troy Nichols, and Laurie Mihalaki. Aug 81, 17p Rept no. MERADCOM-2333

A method is presented for the determination of sodium gluconate in the Type I MIL-C-14460B corrosion-removing compound. The procedure consists of the extraction of sodium gluconate as gluconic acid, silylation, and quantitation by gas-liquid chromatography. Qualitative confirmation of sodium gluconate is made through the retention time of the silyl derivative on the chromatographic column. (Author)

Laser-Stimulated Molecular Dynamics and Rate Processes.
Technical rept.,
Thomas F. George. Nov 81, 54p Rept no. TR-14
Contract N00014-80-C-0472

A review of theoretical work by the author and collaborators and related experiments is presented for two segments of laser-induced chemistry: molecular dynamics and rate processes in the gas phase and at a solid surface and gas-surface interface. For the gas phase, the focus is on situations where the radiation interacts directly with the dynamics to enhance or create new processes. The field of laser-surface chemistry is still undergoing a procedure of definition, and progress to date is discussed. Theoretical failures as well as successes are analyzed and viewpoints are offered as to new directions for both theory and experiment. (Author)

Characterization of Pollutants at Holston Army Ammunition Plant,
T. H. Chen, C. Campbell, and W. J. Fisco. Oct 81, 44p ARLCD-TR-81035, AD-E400 722

The development of reliable analytical methodologies for the identification and qualification of explosives and related pollutants in effluent wastewaters and the results obtained by direct instrumental techniques are described. This study included the evaluation of sample degradation during storage, a comparison of solvent extraction and other concentration techniques, and the development of an isotope dilution technique. The major pollutants quantified are, in the order of decreasing abundance, 1,3,5-trinintro-1,2,5-triazacyclohexane (RDX), 1-Acetyl-3,5,7-trinitro-1,3,5,7-tetraazacycooctane (SEX), 1,3,5,7-tetranitro-1,3,5,7-tetrazacyclooctane (HMX), and 2,4,6-trinitrotoluene (alpha-TNT) for the organic compounds, and sulfate, chloride, sodium, potassium, and ammonium ions for the inorganic ions. The concentrations of copper, cadmium, and chromium were found to be, respectively, about 10, 1, and 0.02 ppb.

Isotope Effect in Gas-Surface Vibrational Energy Transfer. Cyclopropane and Cyclopropane-d6 Isomerization by the VEM Technique.
Technical rept.,
W. Yuan, R. Tosa, K. -J. Chao, and B. S. Rabinovitch. 20 Oct 81, 27p
Contract N00014-75-C-0690

The study of varying molecular structure on the efficiency of vibrational energy transfer between molecules and a hot surface has been extended to the pair, cyclopropane/cyclopropane-d6. The latter is less efficient in energy loss, as corresponds to the greater vibrational eigenstate density. Conversely, the probability of energy up-transitions is enhanced; in thermal low pressure unimolecular reactions this corresponds to the inverse statistical weight secondary isotope effect. (Author)

Corrosion Mechanism of Cu-9.4 Ni-1.7 Fe Alloy in 3.4 WT.% NaCl Solution with and without Sulfide Contamination.
Doctoral thesis,
Chiaki Kato. 3 Aug 81, 125p Rept no. ARL/PSU/TM-81-181
Contract N00024-79-C-6043

Corrosion products were developed on commercially available Cu-9.4 Ni-1.7 Fe alloy discs which rotated at 800 r.p.m. in 3.4 wt. % NaC1 solution with and without sulfide contamination for various lengths of time up to 10 days. The developed corrosion products were characterized with X-ray diffraction, SEM, and ESCA studies. Anodic and cathodic polarization curves were measured on the corrosion-product covered alloy surface as well as on the fresh surface to study the electrochemical behavior of the alloy. The results show that (i) the weight loss of the alloy during immersion in clean solution increases with time according to a parabolic rate law which is due to the mass-transfer limited anodic metal dissolution rate, and (ii) the cathodic oxygen reduction reaction on the corrosion-product covered alloy in the clean solution is controlled by the poor catalytic nature of the corrosion products; however, this catalytic capability is improved by the addition of sulfide during the formation of the corrosion products, thus a high corrosion current is obtained in sulfide-polluted 3.4 wt. % NaC1 solution. Energy and Tangential Momentum Accommodation on Different Flashed Tungsten and Gas Covered Tungsten Surfaces.
Technical rept. 1980-1981,
F. Douglas Shields. 29 Oct 81, 40p
Contract N00014-78-C-0583

The acoustical method has been used to determine energy and tangential momentum accommodation coefficients on three different polycrystalline tungsten surfaces. To obtain the second surface, the first was highly oxidized and then cleaned by vacuum flashing at 2150 K. The third surface, manufactured by the same chemical deposition process as the first, was

specified as having 1/2 the microscopic roughness of the first. Photographs made with the scanning electron microscope indicate that though the oxidation dramatically increased the roughness of the surface, this roughness was removed in the flashing process. The electron micrographs also showed that flashing dramatically increased the grain size in the third surface. This third surface, though supposedly smoother, was found to have larger AC values than the first. This has been attributed to a shorter accumulated flashing time at the time the measurements were made and, therefore, smaller grain size. The microscopic roughness does not appear to be an important factor in determining AC values after the surface is flashed. The problem of simultaneously determining energy and tangential momentum accommodation coefficients is discussed.

Structure Study of Oxygen-Adsorbed Ni(111) Surface by High Energy Ion Scattering.
Technical rept.,
T. Narusawa, W. M. Gibson, and E. Toernqrist. 4 Nov 81, 35p Rept no. TR-6
Contract N00014-79-C-0991
Prepared in cooperation with New York State Univ. at Albany, Institute for Particle Solid Interaction.

Surface atomic structures of clean, oxygen-adsorbed, and oxidized (111) nickel have been studied quantitatively by using MeV ion scattering in combination with AES and MEED. We show that; the clean (111) nickel surface has the bulk-like structure with reconstruction or relaxation less than 0.02 A, the surface thermal vibration amplitude is enhanced by approx. 20% compared to the bulk value, adsorbed oxygen results in surface lattice expansion by approx. 0.15 A which is closely correlated to the p(2x2) or (sq root 3 times sq root 3)R30 degrees superstructure, and oxidation at room temperature saturates at a stage which incorporates approx 3 monolayers of nickel in a stoichiometric amorphous film of NiO whereas at temperatures higher than approx. 200C thicker oxide films are produced. Our study indicates that each oxygen atom adsorbed on the Ni(111) surface interacts with and relaxes three nearest neighbor nickel atoms, and after saturation of the relaxation, oxidation of three monolayers takes place abruptly after which the oxide layer on the surface apparently blocks further reaction.

Effects of Temperature on Excited-State Descriptions of Luminescent Photoelectrochemical Cells Employing Tellrium-Doped Cadmium Sulfide Electrodes.
Technical rept.,
Arthur B. Ellis, and Bradley R. Karas. 6 Oct 81, 15p Rept no. TR-7
Contract N00014-78-C-0633

The effect of temperature on excited-state deactivation processes in a single-crystal, n-type, 100 ppm CdS:Te-based photoelectrochemical cell (PEC) employing aqueous polychalcogenide electrolytes is discussed. While serving as electrodes these materials emit: (lambda sub max is about 600 nm). Photocurrent (quantum yield Thi sub x) from ultraband gap (greater than or approx. = 2.4 eV; greater than or approx. = 500 nm) 501.7 nm excitation increases modestly by less than 20% between 20 degrees and is 100 C degrees; photocurrent from band gap edge 514.5 nm excitation increases by about an order of magnitude, reaching is approx. 50-100% of the room temperature 501.7 nm value. Highlighting the competitive nature of emission and photocurrent as excited -state decay processes, luminescence (quantum yield Thi sub R) declines over the same temperature regime by factors of between 10 and 30. At most, modest red shifts of Lambda sub Max (less than 10 nm) are observed in the spectral distribution of emission with temperature. These effects are discussed in terms of optical penetration depth, band bending, and the known red shift of the CdS absorption edge with temperature. Correlations involving Thi sub x and Thi sub r suggested by the data are discussed.

Palladium-Catalyzed Coupling Reactions: Mechanism of Reductive Elimination. Progress Report, October 1, 1980-June 30, 1981.
J. K. Stille. Jun 81, 28p DOE/ER/04903-3
Contract AS02-78ER04903

The mechanisms of the reductive elimination of alkyl partners from palladium, particularly under reaction conditions characteristic of the palladium-catalyzed coupling of organic halides and organometals, can take place either from Pd(II) or Pd(IV). The coupling of alkyl groups from a dialkylpalladium(II) complex requires that the organic partners be cis to one another. The reaction is a first-order intramolecular process that sometimes requires prior dissociation of a ligand, leading to a Y-or T-shaped intermediate. Coupling also can take place by the prior oxidative addition of organohalide to the dialkylpalladium(II) complex to yield a palladium(IV) species from which reductive elimination takes place rapidly. The reductive elimination step takes place with retention of geometry at an sp exp 2 carbon, and retention of configuration at an sp exp 3 carbon. Which catalytic reversible cycle, Pd(O) implies Pd(II) or Pd(II) implies Pd(IV) operates depends on the organic groups, the ligands and the reaction solvent. (ERA citation 06:035275)

Research in Nuclear Chemistry. Progress Report, March 1, 1981-February 28, 1982.
G. R. Choppin. 1981, 23p DOE/ER/01797-T1, ORO-1797-98
Contract AS05-76ER01797

Investigation of the properties of the actinide elements in aqueous solution continued. Analogous and complementary studies of lanthanide cations were conducted also. Potentiometry, calorimetry, solvent extraction, and nuclear magnetic resonance were the principal techniques. Evaluation of the thermodynamic values of complexation with series of alkyl dicarboxylate ligands provided understanding of the ring size for chelated complexes of these metals. Five- and-six membered chelate rings form but unless other geometrical features favor chelation, it does not seem to occur for ring sizes greater than seven. From a similar study of complexation with aromatic polycarboxylate lignas, transfer of negative charge through the pi system of the ligand enhanced the strength of complexation. Study of the PuO sub 2+2 -bicarbonate system showed that two species formed in the solutions. We assigned as these species PuO sub 2 (OH) (HCO sub 3) exp -1 and PuO sub 2 (CO sub 3) sub 2-2 . In sea water, our results indicate that soluble Pu(VI) exists about equally as PuO sub 2 (OH) sub 2 and PuO sub 2 (OH) sub 2 (HCO sub 3) exp -1 with very little PuO sub 2 (CO sub 3) sub 2-2 . This reflects a substantial difference from U(VI), as the dominant form in sea water is UO sub 2 (CO sub 3) exp -2 . A significant achievement was the automation of the titration calorimeter. This allows simpler, and more sensitive operation. Techniques for studying the redox behavior of Pu(VI) and Np(V) in the presence of organic complexing ligands were developed and initial studies begun. (ERA citation 06:035303)

Thermodynamic Data for Flue-Gas Desulfurization Processes.
L. Brewer. Aug 81, 56p LBL-11758, CONF-801176-1
Contract W-7405-ENG-48
Flue-gas desulfurization conference, Morgantown, WV, USA, 6 Nov 1980.

The efficient design of processes for removal of sulfur dioxide resulting from coal and oil combustion requires thermodynamic and kinetic data for the various materials that might be used in the processes. Examination of the available thermodynamic data for sulfur compounds indicates serious uncertainties and a complete review is planned to provide the best set of internally consistent values obtainable from the literature and from current experiments. Although the main emphasis will be on information needed for aqueous limestone or lime slurry treatment, the data could also be used for other processes covering a wider temperature range. Thus it is planned to provide the data, when possible, for the range from room temperature to at least 1000K. The present compilation covers most of the materials that might play a role in SO sub 2 extraction processes and for which data were found. Supplements will be issued as data are obtained for additional substances of interest. (ERA citation 06:034239)

Synchronous Fluorescence/Matrix Isolation Method for Trace Organic Analysis. Progress Report, July 1980-July 1981.
H. L. Pardue. 1981, 5p DOE/EV/10240-T1
Contract AC02-79EV10240

The first phase of the project involved assembling the instrumentation, constructing the computer interface, writing computer software, and preliminary testing. The principal components of the system are a high intensity Xenon arc lamp for excitation, two flat field f/4 spectrographs (J-4 Model UFS-2000) for dispersion of excitation and emission spectra, fused silica cuvette, an image dissector camera system (EMR Photoelectric 658A) for detection of emission intensity, a custom designed and constructed computer interface for scan control and data acquisition, and PDP-8 computer with assorted peripherals. Preliminary data indicate a range of at least 400 nm can be resolved to about 1 nm for both excitation and emission spectra. Computer interface and software are designed to permit any one of three modes of operation, namely a) the diagonal scans required to generate synchronous fluorescence spectra directly, b) random access to any set of excitation/emission coordinates, and c) total scans of any selected area (up to 100%) of the complete set of excitation/emission coordinates. The complete system became operational in late 1980 and we have been evaluating the system since that time. Data for anthracene are presented here to illustrate system response. Phonons in Alkali Graphite Intercalation Compounds.
H. Zabel, and A. Magerl. 1981, 4p DOE/ER/01198-1365, CONF-810872-2
Contract AC02-76ER01198
International conference on phonon physics, Bloomington, IN, USA, 30 Aug 1981.

The (001)L phonon branches of alkali-graphite intercalation compounds C/sub x/M (x = 8, 24, 36; M = K, Rb, Cs) have been measured by means of inelastic neutron scattering experiments. In all cases the phonon branches show zone folding effects, due to the enlarged unit cell as compared to pristine graphite, along with opening of frequency gaps at the center and boundary of the Brillouin zone. All measured (001)L phonon dispersions are describable by one-dimensional shell models with different masses and force constants to account for the graphite and alkali area-mass densities along the c-axis and their interplanar interactions. Thermal Expansion of Alkali-Graphite Intercalation Compounds.
S. E. Hardcastle, and H. Zabel. 1981, 4p DOE/ER/01198-1364, CONF-810872-3
Contract AC02-76ER01198
International conference on phonon physics, Bloomington, IN, USA, 30 Aug 1981.

The c-axis thermal expansion of several alkali-graphite intercalation compounds has been measured by means of x-ray scattering between 15 and 300 K. The thermal expansion depends strongly on the stage of the compound and is largest for C sub 8 M (M = K, Rb, Cs) compounds. The data have been analyzed in terms of an one-dimensional quasi-harmonic approximation, which yields Grueneisen parameters two or three times as large as for pristine graphite. Development of Catalytic Systems for the Conversion of Syngas to Jet Fuel and Diesel Fuel and Higher Alcohols. Annual Report.
W. A. Slegeir. Oct 80, 18p BNL-51423
Contract AC02-76CH00016

Highlights of the year's research activities are reported. A highly active series of Fischer-Tropsch catalysts were developed during FY 1980, on the basis of insights provided by the oxide theory. The method of catalyst formulation is unique in Fischer-Tropsch chemistry, yet is simple and reproducible. These catalysts offer the promise of being superior to ordinary catalysts for hydrocarbon synthesis with regard to rate, operating conditions, and, quite possibly, product selectivity and longevity. The products of these catalysts appear to be ideally suited for use as diesel and jet fuels. Once formed, the catalysts display remarkable stability toward air. Specific descriptions of catalyst preparations and composition of matter must be withheld pending patent protection. Also during FY 1980, an exploratory program was directed toward achieving a better understanding of support effects, oxide interactions, the role of promoters, and the synergistic behavior of bimetallic catalysts systems. Some results dealing with bimetallic systems for hydrocarbon and alcohol synthesis are discussed. (ERA citation 06:034419)

Infrared and Structural Analyses of Uranium Oxidation Products: Preliminary Results.
E. L. Fuller, Jr., N. R. Smyrl, M. H. Eager, and J. B. Condon. Aug 81, 60p Y/DK-276
Contract W-7405-ENG-26

Water vapor oxidation of uranium follows a cyclic process: (1) rapid oxidation to form a thin dense, adherent layer of uranium dioxide, (2) slow diffusion of H sub 2 O and H sub 2 through this oxide, until (3) a thickness of 0.2 to 0.3 nm is achieved in a strained state that (4) relaxes from the surface allowing further (1) contiguous oxide formation and finally (5) the shards of oxide comprised of oxide laminae spall completely free of the metal surface. The oxide thus formed is hydrated on the surface. Diffuse reflectance infrared Fourier transform spectroscopy shows that these are several distinct modes of water binding delineated with respect to energetics and reversibility. Scanning electron microscopy aids immensely in defining the nature of the laminae. Implications and suggestions for further work are given to aid in a better understanding of corrosion processes. Studies of Free Radicals by Ultraviolet Excimer Laser Photolysis. Progress Report, 1 April 1981-1 October 1981.
S. R. Leone. 1981, 29p DOE/ER/10396-T1
Contract AS02-79ER10396

Recent progress is described on the study of the reactions, energy transfer, and dynamics of free radicals produced by ultraviolet laser photolysis. Free radical chain reactions are analyzed by fully time-resolved techniques involving infrared emission spectroscopy. Some of the most recent results include a mesurement of the low resolution infrared spectrum of the CH sub 3 (nu sub 2) out-of-plane bending vibrational progression. Complex chain reaction chemistry has been studied via the laser-initiated chain reaction technique to provide a general analysis of the method to obtain rate constants and to probe the time evolution of energy disposal and product formation. Methods have been developed to probe very slow chain reactions and to measure absolute rate constants for methyl radical reactions. A brief review of results from previous years is also given. Laser-Induced-Fluorescence Studies of Fragment Ions: CH Exp + and CD exp +.
A. O'Keefe. Aug 81, 114p LBL-13258
Contract W-7405-ENG-48
Thesis.

The dynamics of ion-molecule interactions within a mass selective rf quadrupole ion trap are studied for several ion-molecule systems. Laser induced fluorescence is used as a probe of the internal energy distributions of molecular ions under collision free conditions and under controlled collision conditions. The effects of collisions at near thermal energies (0.3 to 0.5 eV) are easily understood in terms of processes such as charge transfer and other energy transfer mechanisms. The A exp 1 PI - X exp 1 sigma exp + system of CH exp + and CD exp + has been examined under collision free conditions. The ions were produced from methane through electron impact ionization/dissociation. The observed energy distributions reflect the dynamical partitioning of dissociation exothermicity, excepting short lived electronic states. Many new transitions belonging to this electronic system have been observed and a reliable vibrational frequency for the X exp 1 sigma exp + state has been obtained. The radiative lifetimes of CH exp + and CD exp + A exp 1 PI(v = 0) states have been measured and a revised oscillator strength for the A-X transition has been derived from this data. Influence of Grain Size on the Determination of Heavy Elements by the gamma-gamma Method.
J. Charbucinski, and K. Umiastowski. 1976, 34p
U.S. Sales Only.

The purpose of the present paper was to establish the influence of the grain size on the determination of the heavy element content by the gamma-gamma scattering method. To solve this problem Monte-Carlo numerical calculations and model measurements were performed. The calculations and measurements were performed for exp 75 Se, exp 137 Cs, and exp 60 Co sources, for lead concentrations of 1%, 3% 5%, and 10%. Grain size was varying in the 0.1 mm to 9.0 mm range. Monte-Carlo calculations and experimental data proved the strong dependence of scattered gamma radiation on the grain size of heavy metal. (Atomindex citation 10:432194)

Using Diffusion Measurements to Determine Pore-Size Distributions in Porous Materials.
L. F. Brown, and B. J. Travis. 1980, 19p CONF-800610-5
Contract W-7405-ENG-36
American Institute of Chemical Engineering conference, Philadelphia, PA, USA, 8 Jun 1980.

A method for determining pore-size distrbutions from diffusion measurements is presented. A Wicke-Kallenbach experiment, for measuring diffusion fluxes within porous materials, was carried out over a significant portion of the transition range between Knudsen flow and bulk diffusion. If the internal porous structure of the material is modeled as myriad nonintersecting cylindrical pores, an equation may be derived for the flux as a function of pressure, in which the flux is a functional of the pore-size distribution. The equation is a Fredholm integral equation of the first kind. This is an application of the general inversion problem, and solution of the equation for the pore-size distribution is possible. It is demonstrated from calculated fluxes using postulated ideal distributions that the method works very well for both unimodal and bimodal distributions. The method is no extraordinarily sensitivire to experimental error. An example of a distribution obtained from a commercial porous catalyst is presented and compared with that obtained by mercury porosimetry. (ERA citation 05:020883)

Partitioning of Major, Minor, and Trace Elements During Simulated in-Situ Oil Shale Retorting.
J. P. Fox. May 80, 454p
Contract W-7405-ENG-48
Thesis.

The fate of inorganic constituents in Green River, Antrim, and Moroccan oil shales during in-situ retorting has been investigated. The partitioning or distribution of 50 elements to the spent shale, shale oil, retort water, and gases was studied by completing mass balances for several runs of three simulated in-situ retorts. Byproducts and products from 24 simulated in-situ retort runs were analyzed. The effect of shale origin and retort operating conditions, including temperature, particle size, atmosphere, and gas flow rate, on partitioning patterns was investigated, and the resulting data were used to develop a conceptual model of elemental partitioning during simulated in-situ retorting. Most of the 50 elements studied are not significantly mobilized during in-situ retorting. The only elements that are distributed in large quantities to the byproducts are C, H, N, S, Cd, and Hg. Lesser but environmentally significant quatities of Se, As, Ni, and Co are distributed to the oils and waters, and at retorting temperatures in excess of about 900 exp 0 C, Se is mobilized to the gas phase. Mercury and Cd were the most mobile trace metals studied. About 70% of the Hg and 30% of the Cd were distributed to the gas phase. Mercury was released as a series of pulses in the last third of a retort run. Thermodynamic calculations indicated that elemental Hg is the major stable gas-phase species in all zones of an in-situ retort. The work demonstrated that elemental partitioning is controlled by the mineral residence of an element and the retort operating conditions employed. Significant differences were observed in the mobility and partitioning patterns of Green River, Antrim, and Moroccan oil shales. The only retorting conditions that had a statistically significant effect on partitioning patterns were temperature, input gas, particularly steam, and retort design and operation. Cooling by Conversion of Para to Ortho-Hydrogen.
Patent Application,
A. Sherman. Filed 10 Sep 81, 14p N82-10358/1, NASA-CASE-GSC-12770-1
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

The cooling capacity of a solid hydrogen cooling system is significantly increased by exposing vapor created during evaporation of a solid hydrogen mass to a catalyst and thereby accelerating the endothermic para-to-ortho transition of the vapor to equilibrium hydrogen. Catalysts such as nickel, copper, iron or metal hydride gels of films of nickel, copper or iron or hydride gels of nickel, copper or iron in a low pressure drop catalytic reactor are suitable for accelerating the endothermic para-to-ortho conversion.

On-Site GC/MS Analysis of Chapman Gasification Separator Liquor.
Final rept. Jul 80-Mar 81,
C. J. Thielen, R. A. Magee, and R. V. Collins. Aug 81, 45p EPA-600/7-81-136
Contract EPA-68-02-3137

The report gives results of a characterization of a wastewater stream from a coal gasification plant, using on-site extraction and GC/MS analysis. Extractable material in the wastewater was primarily phenols and alkylphenols, accounting for about 99% of the total mass identified. Several polynuclear aromatic compounds were also identified. The composition of the sample deteriorated even though the water was held in amber bottles at 4C: this was most evident in the concentration of dimethylphenols which dropped about 75% during 2 weeks of refrigerated storage. Ambient sample storage produced a greater decrease in the concentration of phenol, but did not appear to affect the alkylphenols or the base/neutral compounds as much. The observed changes in composition should hamper any off-site wastewater treatbility studies with waters of this type. Diisopropyl ether (DIPE) extraction confirmed the 99-plus % removal efficiency of phenol which had been demonstrated in previous studies. Wet oxidation removed organics almost as efficiently as DIPE extraction, but may have limited use because of its high operating cost.

An Analysis of Markovian Model Microfield Methods for Stark Broadening.
Final rept.,
Earl W. Smith, Bernard Talin, and J. Cooper. 1981, 33p
Pub. in Jnl. of Quantitative Spectroscopy and Radiative Transfer 26, n3 p229-242 1981.

Stark broadening theories which concentrate on the statistics of the plasma electric microfield rather than the dynamics of collisions have come to be known as Model Microfield Methods. In the present paper, the authors present an analysis of Stark broadening problems based on Markovian model microfield statistics. Our derivation permits an easy comparison with traditional Stark broadening theories such as the impact and unified theories; this comparison is used to clarify the physical nature of the approximations employed by Markovian models. The strength and weaknesses of various models are discussed, emphasizing the kangaroo process of Brissaud and Frisch, and methods are suggested for improving the current model microfield approach.

The Direct Determination, by Differential Pulse Anodic-Stripping Voltammetry at the Thin Mercury-Film Electrode, of Cadmium, Lead, and Copper,
A. F. Lee. 21 Aug 81, 45p NIM-2124, ISBN-0-86999-550-2

This report describes the development and application of a voltammetric procedure for the direct, simultaneous determination of cadmium, lead, and copper in three SAROC reference materials (carbonatite, magnesite, and quartz). The electrolyte was a mixture of 1 M ammonium chloride, 0,1 M citric acid, and 0,025 M ascorbic acid. No interferences were encountered from Fe(III), As(III), Sb(V), Tl(I), or In(III) at the concentrations present in the samples. Intermetallic interferences were eliminated by the use of thin mercury-film electrodes not less than 80 nm thick. Limits of detection were determined by the degree to which the supporting electrolyte could be purified, and were estimated to be 10 ng/g, 250 ng/g, and 150 ng/g for cadmium, lead, and copper respectively.

Nitrogen Sensitivities of a Sample of Commercial Hot Cathode Ionization Gage Tubes.
Final rept.,
K. E. McCulloh, and C. R. Tilford. Apr 81, 3p
Sponsored in part by Department of Energy, Washington, DC.
Pub. in Jnl. of the Vacuum Science and Technology 18, n3 p994-996 Apr 81.

In order to help assess the magnitude of errors that might arise from the use of uncalibrated ionization gage tubes and help select the best type of tube when accurate measurements are required the authors have determined the nitrogen sensitivities from 10-5 to 10-2 Pa for lots of from two to four each of five different types of commercial hot cathode gage tubes. Included were conventional triodes and B-A structures of four distinct types. Two types with tungsten filaments -- the triodes and tabulated B-A structures -- were markedly superior to the others with respect to agreement with manufacturer's sensitivity, linearity, and uniformity of sensitivity within a type. The least satisfactory results were obtained from the nude B-A structures, which showed significant nonlinearities, sensitivities ranging from 70%-110% of the manufacturer's value, and typical 25% differences in sensitivity between the two filaments of a dual-filament structure.

Electron-Ion Collisions.
Final rept.,
G. H. Dunn. 1980, 47p
Pub. in Proceedings of the Physics of Ionized Gasses, Dubrovik, Yugoslavia, August 25-30, 1980, p49-95.

Worldwide interest in and excitement over both controlled thermonuclear fusion and space physics coupled with advancing technology have generated significant efforts to determine cross sections for electron collisions with ions. Early work in various laboratories dates from the late 1950's, but it was not until 1961 that a successful measurement was reported. Since that time much work has been done and a number of reviews have been written on experimental techniques and results as well as on theory. This paper will emphasize experimental results and methods, with an attempt to update the excellent review of Dolder and Peart, which has a similar emphasis. Some overlap occurs with the Dolder and Peart paper; since some issues facing the field remain the same, and methods and examples for orientation and clarification may be the same. Processes of high interest in electron-ion collisions include: excitation, ionization, recombination, dissociation, and detachment. Only the first three will be discussed here. Rate measurements in plasmas also, of course, give valuable information about the processes in question and rate coefficients are -- in many cases -- what the user community ultimately needs for modelling and diagnostics. However, the author confines the discussion here to cross sections from which rate coefficients may be calculated and

which make a more meaningful test of theory. An extensive bibliography is included.

Electron Impact Ionization Cross Sections and Rates for Highly Ionized Atoms.
Final rept.,
S. M. Younger. 1981, 9p
Sponsored in part by Department of Energy, Washington, DC.
Pub. in Jnl. of Quantitative Spectroscopy and Radiative Transfer 26, n4 p329-337 1981.

Electron impact ionization cross sections and rates for hydrogen-, helium- and lithium-like ions are presented in simple analytical form, based on a set of parameters used in the formulae allow rigid generation of cross sections and rates for any ion in these sequences with a minimum of computational effort. The use of accurate Bethe slopes in the cross section-fitting algorithm yields good accuracy both in the near threshold and high energy regions. The rate coefficient is given in the form of a correction to the commonly used Seaton formula and is thus readily adaptable to existing plasma modeling computer codes. Comparisons of the present results with other theoretical and experimental data are made.

The Adsorption of NO on Ni (111): An ESDIAD/LEED Study.
Final rept.,
Falko P. Netzer, and Theodore E. Madey. 1981, 10p
Sponsored in part by Office of Naval Research, Arlington, VA.
Pub. in Surface Science 110, p251-260 1981.

The ESDIAD method (electron stimulated desorption ion angular distributions) has been combined with LEED (low energy electron diffraction) in a study of the adsorption of NO on Ni(111). For adsorption at 80 K, NO appears to be bonded with its molecular axis perpendicular to the Ni(111) surface at all coverages. Heating the 80 K layer leads to a striking structural change which the authors interpret as the formation of inclined or bent NO in the range 120 less than or equal to T less than or equal to 250 K. Upon adsorption at 150 K, only the bent form of NO is present at low coverages; at higher coverages at 150 K, the perpendicular form appears, in agreement with recent electron energy loss spectroscopy (EELS) data of Lehwald, Yates, and Ibach. When NO is coadsorbed with p(2 x 2) oxygen, the perpendicular form of NO dominates at all coverages and temperatures studied. Dissociated NO adsorbed at steps and defect sites on Ni(111) produces a well-defined hexagonal ESDIAD pattern.

The 4f(13)5f Configuration in the Isoelectronic Sequence of Yb III.
Final rept.,
J. F. Wyart, V. Kaufman, and J. Sugar. 1981, 10p
Pub. in Physica Scripta 23, p1069-1078 1981.

Energy levels of the configuration 4f(13)Sf have been observed for the first time in the spectra of Lu IV, Hf V, Ta VI, and W VII and have been interpreted by means of the Slater-Condon theory. The relative positions of two perturbing configurations 4f(12)Sd(2) and 4f(14)5p(5)5f are discussed. The jj coupling scheme provides the best average purity for the labeling of the levels. Three hundred seventy-seven lines have been classified in these four spectra.

Behavior of a Nonconformal Mixture via Computer Simulation.
Final rept.,
H. J. M. Hanley, and Denis J. Evans. 1981, 19p
Sponsored in part by Fulbright Foundation, Washington, DC.
Pub. in Int. Jnl. Thermophys. 2, n1 p1-19 1981.

A binary 50% mixture of soft spheres is studied via nonequilibrium molecular dynamics, and the equilibrium and nonequilibrium radial distribution functions for a nonconformal mixture with a mass ratio of 10 and a size ratio of about 2 are examined. This model system is related to the real methane/decane mixture, and it is shown that apparently anomalous properties of this mixture, especially the viscosity, could perhaps be understood in terms of the local or ambient mole fraction. In addition, the postulates of the Van der Waals one fluid conformal solution theory are discussed, and a mixing rule for the mass is derived.

The Certification of Polycyclic Aromatic Hydrocarbon Materials (PAH). Part II: The Six Methylchrysene Isomers (BRC Reference Materials No. 77, 78, 79, 80, 81 and 82),
W. Karcher, R. Fordham, and J. Jacob. 1981, 43p
EUR-7175-EN
Customers in the European Community countries should apply to the Office for Official Publications of the European Communities, B.P. 1003, Luxembourg.

The purity of six synthesized PAH materials (all six methylchrysene isomers) was determined in an interlaboratory exercise of laboratories of EC Member Countries and of two laboratories of the Commission of the EC. The purity analysis was carried out using independent analytical methods (gas chromatography, high performance liquid chromatography and mass spectrometry). The certification procedure and experimental details of the analyses are described.

Kinetics of Gas Hydrate Formation. Part I: Kinetics of Ethane Gas Hydrate Formation. Part II: Kinetics of Natural Gas Hydrate Formation.
Final rept. Jun-Dec 80,
P. Raj Bishnoi, and Anthony Vysniauskas. 18 Dec 80, 45p GRI-80/0100
Contract GRI-5080-363-0312

The kinetics of formation of ethane gas hydrate and a natural gas hydrate were investigated. The ethane gas hydrates were studied in the temperature range from 274.9 to 282.3 K at pressures from 7 to 20 bars. The natural gas hydrates were investigated in the temperature range from 275.9 to 279.7 K at pressures from 13 to 37 bars. The reaction rate characteristics for ethane and the natural gas were found to be similar to those for methane. An increase in pressure increases the reaction rate whereas a corresponding increase in temperature decreases the reaction rate. The order of the reaction with respect to pressure is close to three and the apparant energy of activation was found to be negative. The model used to correlate the data was the same as that used for methane hydrate formation and appears to be consistent with the experimental data.

Improvements to Asbestos Diaphragms and Prospects for Their Replacement (Verbesserung von Asbest-Diaphragmen und deren eventueller Ersatz).
Final rept.
c1980, 30p
Text in German.
Customers in the European Community countries should apply to the Office for Official Publications of the European Communities, B.P. 1003, Luxembourg.

Diaphragms and membranes for use in alkaline water electrolysis and manufacture of asbestos or reinforced asbestos, plastics materials, ceramics, carbon, sintered or porous nickel were tested and compared for their permeability to liquids, for gas separation, electrical resistance in electrolytic operations, and for degradation at higher temperatures. A cost/effectiveness exercise, additionally taking into account the relation between higher current density and low voltage, showed that specially selected asbestos materials still are the recommended materials, although a polypropylene-PTFE diaphragm had some advantages.

Theoretical Study of the Process of Unimolecular Dissociation of Radicals (Etude Theorique des Processus de Dissociation Unimoleculaire des Radicaux),
Balkacem Mouflih. 2 Mar 79, 116p
Text in French.

Chemists have long used mass spectrometry as a means of access to molecular structures. A series of empirical rules permit the forecasting of the fragmentation of an organic molecule under electronic impact. A coherent theory was then required to explain and forecast the observed fragmentations. This study reviews the different theoretical models proposed; different methods of quantum mechanics frequently used are discussed. A study of the process of dissociation ionization of a certain number of molecules is made, using methods of calculus on the different models. The 'quality' of the function of the wave utilized (semi-empirical or ab initio) for the results obtained is examined. Recently developed methods in photochemistry are applied to mass spectrometry. The study is limited to the methanol molecule.

Prediction of the Critical Line of a Binary Mixture: Evaluation of the Interaction Parameters,
B. E. Eaton, J. Stecki, P. Wielopolski, and H. J. M. Hanley. 23 Mar 81, 9p
Prepared in cooperation with Polish Academy of Sciences, Warsaw. Inst. of Physical Chemistry. Sponsored in part by National Bureau of Standards, Boulder, CO. and National Science Foundation, Washington, DC.
Included in Jnl. of Research of the National Bureau of Standards, v86 n5 p419-427, Sep-Oct 81.

The critical line of the binary mixture methane-ethane is calculated via the extended corresponding states Van der Waals one fluid theory. The Gibbs free energy criticality criteria are solved numerically. The numerical derivatives are compared with the exact analytical results derived previously for the special case of the shape factors of the extended corresponding states set equal to unity. Binary interaction parameters are adjusted to give a best fit of the critical line to experimental data. These interaction parameters are then used to evaluate vapor liquid equilibrium data away from the critical region. It appears that a fit of the critical line is not sufficient to obtain binary interaction parameters of general applicability. Optimization of the critical point predictions for the pure components is also discussed.

Propagation of Density Fluctuations in Nonuniform Fluids: Simple Models,
James C. Rainwater. 4 May 81, 27p
Included in Jnl. of Research of the National Bureau of Standards, v86 n5 p429-455, Sep-Oct 81.

As a first step toward the understanding of Rayleigh-Brillouin scattering from a fluid with a temperature gradient, the author analyzes the initial value problem for certain prototype one-dimensional nonuniform systems. For sufficiently short times and localized initial pulses, it is not necessary to impose actual physical boundaries on the linearly nonuniform system. By a straightforward, though unconventional, application of Fourier and Laplace transform methods, explicit and physically reasonable solutions are constructed for the propagation of fluctuation pulses in space and time according to the nonuniform wave and diffusion equations and a special case of the nonuniform damped wave equation. The analog of the dynamic structure factor is also constructed for the latter two cases.

Evaluation of Gamma Radiation for Destruction of Pentachlorophenol in Aqueous Solution and on Activated Carbon.
Doctoral thesis,
Stephen Grant TerMaath. Dec 79, 97p Rept no. AFIT-CI-79-307D-S

This research was conducted to determine the applicability of gamma radiation from a cobalt 60 source as a treatment method for low concentrations of toxic or hazardous materials in aqueous solution. Irradiation of the toxic materials toluene, trichloroethylene and pentachlorophenol (PCP) showed their susceptibility to radiation treatment when destruction of the initial material was used as the main criteria for evaluating experimental results. Initial PCP concentrations of 5,15 and 25 mg/1 were reduced to a level of one part per billion at absorbed dosages of 100, 200 and 300 krads, respectively, and corresponding destruction rates were 5.0, 7.5 and 8.3 mg/1 PCP per 100 krads. The ability to destroy PCP in other than aqueous solution was also examined. Benzene was selected as a solvent because it had a minimum of any degradation products. No PCP degradation was observed in a 25 mg/1 solution at dosages of 300 and 1000 krads. The ability of activated carbon to readily adsorb pentachlorophenol provided a means of concentrating PCP in order to reduce the volume of material that would require radiation treatment. As a result of this irradiation of the carbon, regeneration of activated carbon was achieved.

Contract DACW72-77-C-0013

Sweep nets, corers, enclosures, and clip-quadrat samplers were used to collect both quantitative and nonquantitative samples of invertebrates in level marsh, pan, tidal creek, and tidal flat habitats located in seven study areas representing various types of marsh. Fish in these habitats, as well as in a slough and in bay channels, were sampled by seine and otter trawls. Community taxonomic composition and trophic structure, along with fish stomach contents, are presented as relative frequency histograms and pie charts. Dominant invertebrate taxa in terrestrial collections were Acarina, Homoptera, and Diptera, and in aquatic collections were Capitellidae (polychaeta), Oligochaeta, Gnorimosphaeroma (Isopoda), and Anisogammarus and Corophium (Amphipoda). Three-spine stickleback and young staghorn sculpin were by far the most common fish species throughout the marsh zone; juvenile salmonids and other species were captured only in submerged level marshes and in a slough. Trophic structure of terrestrial and aquatic invertebrate communities was generally heavily weighted to detritivores and scavengers. The herbivore component increased from low marsh to high marsh and was the dominant trophic type in the higher vegetation (sweep net collections) of the high marsh. Araneae was the dominant invertebrate carnivore in the terrestrial communities. Fish consumed primarily aquatic animals, even those captured in tidal creek and submerged level marsh habitats where tidal inundation would be expected to make terrestrial foods available.

Juvenile Salmonid and Baitfish Distribution, Abundance and Prey Resources in Selected Areas of Grays Harbor, Washington.
Final rept. Mar-Oct 80,
Charles A. Simenstad, and Douglas M. Eggers. Sep 81, 228p Rept no. FRI-UW-8116
Contract DACW67-80-C-0102

A comprehensive studies of juvenile salmonids, English sole, and baitfish and their epibenthic and neritic prey communities was conducted in Grays Harbor in order to evaluate the potential effects of dredging proposed for widening and deepening the existing navigation channel. Quantitative stomach analyses of juvenile salmonids and English sole indicated that they fed mainly in the epibenthic and neritic habitats in which they were captured. Fishes occupying shallow sublittoral or lower littoral habitats fed mainly on epibenthic crustaceans--primarily harpacticoid copepods, cumaceans, and gammarid amphipods--while those captured in neritic habitats tended to be larger in size and fed upon more pelagic prey such as larval northern anchovy and drift insects. Potential impacts of the proposed dredging project were considered to be either a direct reduction in the fish populations as a result of dredging operations or an indirect reduction of the carrying capacity by removal of preferred habitat or alteration of migration or residence patterns. Of the indirect effects assessed in this report, only the permanent loss of shallow sublittoral habitat, estimated to involve 1.1% of the total sublittoral habitat in the estuary, may be deleterious particularly to juvenile chinook and chum salmon, and young-of-the-year English sole, which forage and rear almost exclusively in this habitat in Grays Harbor. Marine Bird Populations of the Strait of Juan de Fuca, Strait of Georgia and Adjacent Waters in 1978 and 1979,
Terence R. Wahl, Steven M. Speich, David A. Manuwal, Katherine V. Hirsch, and Christine Miller.
Oct 81, 291p EPA-600/7-81-156
Sponsored in part by National Oceanic and Atmospheric Administration, Seattle, WA. Includes six sheets of microfiche.

The threat of oil pollution in the Strait of Juan de Fuca has prompted this study of marine birds in Washington State. The study was conducted from 1 January 1978 to 31 December 1979 in the Strait of Juan de Fuca north to the San Juan Islands and Point Roberts and west to Sidney, British Columbia. Major objectives were to determine the time of occurrence, distribution, abundance, and locations of important concentrations of marine birds. Data were obtained on breeding marine birds on 99 geographic units in American waters.

Evaluation of Existing Marine Intertidal and Shallow Subtidal Biologic Data,
Judith E. Zeh, Jonathan P. Houghton, and Dennis C. Lees. Jul 81, 278p EPA-600/7-81-036
Prepared in cooperation with Dames and Moore, Seattle, WA. Sponsored in part by National Oceanic and Atmospheric Administration, Seattle, WA. Includes two sheets of microfiche.

This study was initiated in order to evaluate a large set of marine intertidal and shallow subtidal biologic data collected in two baseline study programs in the marine waters of northwestern Washington between 1974 and 1979. This report summarizes and compares methodologies. Communities in three broad habitat categorizations--rocky intertidal, soft substrate intertidal, and subtidal--were examined by means of cluster analysis. For the intertidal habitats, numerical assemblage parameters such as richness, biomass, and diversity were computed and examined by means of multiple regression and analysis of variance to fulfill the first study objective.

Distribution and Abundance of Marine Birds and Mammals Wintering in the Kodiak Area of Alaska.
Rept. for 1979-80,
Douglas J. Forsell, and Patrick J. Gould. Sep 81, 87p FWS/OBS-81/13
Prepared in cooperation with Bureau of Land Management, Anchorage, AK. Alaska Outer Continental Shelf Office.

The search for oil and gas has accelerated research related to environmental assessment of the outer continental shelf and adjacent marine habitats in Alaska. Information on biological communities in winter are especially lacking in this area. This report describes an investigation of the distribution and abundance of marine birds wintering in the Kodiak Archipelago of Alaska. Forty-four species of seabirds and ten species of marine mammals were observed during the winter of 1979-1980 in the Kodiak Archipelago. The species composition of seabirds in the area shifted considerably between summer and winter. Densities in the bays increased in the winter, whereas densities over the continental shelf decreased.

High Solitary Waves in Water: A Refined Numerical Method.
Interim rept.,
James M. Witting, and John M. Bergin. 30 Sep 81, 19p Rept no. NRL-8504

Formerly, finite difference calculations of solitary wave properties gave results different from those obtained from independent methods. Calculations based on an expansion in powers of a small quantity, supplemented by the use of Pade approximates, and calculations based on an integral equation for the wave profile are in satisfactory agreement, except possibly for the highest waves. This report refines and extends a numerical method based on Fourier series solutions of the governing equations. The resultant solitary wave properties agree with those found by independent methods to several significant figures, except for waves having amplitudes within a few percent of that of the highest wave. There appears to be little degradation in the method's accuracy for the highest and very high waves, when compared to waves of intermediate height. This report discusses possible reasons for the failure of other numerical work to achieve high accuracy. (Author)

Prediction of Wave Refraction and Shoaling Using Two Numerical Models.
Coastal engineering technical aid rept.,
Jon M. Hubertz. Aug 81, 16p Rept no. CERC-CETA-81-12

Two numerical models to predict wave refraction and shoaling in shallow water are described. One model is formulated in terms of wave rays, the other in terms of wave spectra. Output from each model is illustrated and compared to observations made at CERC's Field Research Facility at Duck, North Carolina. (Author)

Circulation and Trajectory Calculations in the Eastern Strait of Juan de Fuca Using a CODAR System,
A. S. Frisch, and B. L. Weber. May 81, 29p EPA-600/7-81-089

During the summer of 1978 and 1979, the surface currents of the Eastern Strait of Juan de Fuca were mapped with a high frequency radar system. This system measures surface currents over several hundred square kilometers. In this study, the authors have used data from both years to make a composite picture of the tidal flow over an area covered by the radar in all the experiments. In addition, because of the potential impact from an oil leak along the path of a proposed oil pipeline, the authors have simulated a continuous release of a material and computed a trajectory for a no-wind condition.

Summaries are presented of ocean current velocities, pressures and temperatures recorded by instruments in the POLYMODE Local Dynamics Experiment (LDE) moored array. The LDE array comprised 28 current meters and 15 temperature-pressure recorders on 9 moorings deployed for 15 months in the vicinity of 31 degrees N, 69 degrees 30 min W from April 1978 to July 1979. Summaries of the ten CTD hydrographic stations made on the array recovery cruise are also presented.

Distribution of Actinide Elements in Sediments: Leaching Studies.
M. R. Scott, and P. F Salter. 40p
Contract AS05-76EV03852

Previous investigations have shown that Fe and Mn oxides and organic matter can significantly influence the behavior of Pu and other actinides in the environment. A sequential leaching procedure has been developed in order to investigate the solid phase distribution of the actinides in riverine and marine sediments. Seven different sedimentary fractions are defined by this leaching experiment: an exchangeable metals fraction, an organic fraction, a carbonate fraction, a Mn oxide fraction, an amorphous Fe fraction, a crystalline Fe oxide fraction and a lattice-held or residual fraction. There is also the option of including a metal sufide fraction. A preliminary experiment, analyzing only the metals and not the actinide elements, indicates that this leaching procedure (with some modifications) is a viable procedure. The subsequent data should result in information concerning the geochemical history and behavior of these actinide elements in the environment. (ERA citation 05:032893)

Fast, Accurate Two-Person Beach Surveys.
Coastal engineering technical aid rept.,
William A. Birkemeier. Aug 81, 19p Rept no. CERC-CETA-81-11

Generally, the most accurate beach survey data are obtained using a surveying level to determine elevation and a tape to measure distance; however, this procedure requires a minimum of three people. Commonly used two-person surveying procedures are stadia surveying and the Emery method. In stadia surveying, a level is used to determine elevation; distance is indirectly determined by two additional readings of the level rod. This method gives the same elevation accuracy of level and tape surveying, but requires careful readings of the level rod to obtain accurate distances. The Emery method uses two 5-foot calibrated rods and the horizon to measure distances to, and changes in elevation between, two survey points. Errors are additive and large elevation errors are possible particularly on wide benches. This report discusses a modified stadia surveying procedure which, when used properly, is fast and produces data of comparable accuracy to level and tape surveying. Because more readings are taken (three per survey point), the data provide a higher degree of confidence than is available with the other methods. The modifications include the addition of two stakes to the profile line monumentation, pacing the distance between each point, and performing a simple mental field check of data quality. Using the stadia method, a typical profile of 10 to 15 survey points can be surveyed in 15 to 20 minutes including instrument setup time. (Author)

Inertial Surveying Technology.
Final rept.,
Armando Mancini. 14 Nov 81, 18p

Inertial Surveying is the process of ascertaining position and gravity field parameters from measured accelerations. Typically, the observer traverses the survey course in a vehicle such as a van or helicopter and operates instrumentation which records the vehicle's acceleration history as the survey proceeds. The instrumentation, similar to that used for inertial navigation, consists of very accurate and precise accelerometers, gyros, data recording equipment, a computer, and support electronics. The gyros provide a precise reference frame for the acceleration measurements. The computer integrates the acceleration measurements into velocity and position data to provide a real-time display during the traverse and stores information for later post-survey processing (smoothing). The general theory, operations, system description and results will be presented. (Author)

Geothermal Potential on Kirtland Air Force Base Lands, Bernalillo County, New Mexico.
Contractor rept.,
P. R. Grant, Jr. Oct 81, 65p Rept no. SAND81-7141
Contract DE-AC04-76DP00789
Prepared in cooperation with Energy Resources Exploration, Inc., Albuquerque, NM, and California Univ., Livermore, Rept. no. UC-66.

Public policy expressed in a number of national directives in recent years stresses the conservation of conventional fuel supplies, a switch to alternative fuels, and the application of advanced energy technologies at federal installations. Natural gas currently furnishes 85 to 95 percent of the average 94 x 1,000,000 Btu/hr energy requirements for space heating and cooling at Kirtland Air Force Base. Studies of alternatives to the use of natural gas at the base include examination of the geothermal option. Four of North America's major physiographic provinces coalesce in central New Mexico on or near Kirtland AFB. Their junction is identified throughout much of this region by a tectonic depression occupied by the Rio Grande that is structurally complex, stratigraphically and hydrologically unique, and coincides with geologically recent volcanic centers. This trough, the Rio Grande rift, has been identified as a major geothermal resource area. The western part of Kirtland AFB is in the Albuquerque Basin segment of the Rio Grande rift. Extensive sampling and geochemical analysis of groundwater in and near the base disclosed no significant geothermal parameters. However, structural conditions and current hydrologics regimes strongly suggest that thermal waters would be masked by near surface, low temperature meteoric water originating as rain and snowfall in the nearby mountains.

Symposium on hydrology and geochemistry of the Perch Lake Basin, Chalk River, Ontario, Canada, 25 Apr 1978.
U.S. Sales Only.

The Perch Lake basin is a small drainage system along the Ottawa River about 200 km west of Ottawa on the Canadian Shield. Since 1975, groups of scientists from several Canadian universities and government departments have been studying the hydrological, geological and geochemical properties of the basin. The object of these studies is to develop and test simulation models used to describe the time-dependent mass flow rates of water and dissolved and suspended substances through the basin. To review progress, a symposium/workshop was held at Chalk Rier in 1978 April. This report contains 24 extended summaries of the material presented verbally at the workshop. Subject matters include atmospheric sources and sinks, mass flows through the surface and subsurface regimes in the drainage basins and interactions occurring in the lake. Peat Resource Evaluation: State of Maine. Report for the Quarter Ending August 1981.
J. Davis, and W. Anderson. 1981, 7p DOE/FC/14690-T1
Contract FG18-79FC14690

The DOE/Maine Peat Resources Evaluation Program has been undertaken to determine the amount and location of fuel-grade peat that may be harvested and utilized in an environmentally acceptable manner in Maine. The resources inventory will provide a detailed evaluation of the peat deposits including maps showing areal extent, thickness, and distribution of peat, stratigraphic cross sections, and surficial mapping. Many deposits visited by earlier investigators had to be re-visited to more accurately assess the physical characteristics of the deposits and to obtain laboratory samples. Representative samples from surveyed deposits are obtained through standard field sampling techniques. (ERA citation 06:034251)

Evaluation of Resource-Assessment Values and in-Situ Combustion Potential for the OH-4 and PA-3 Wells. Final Report.
R. E. Zielinski, and R. D. McIver. 24 Jul 81, 158p
MLM-MU-81-67-0008, GRI-79-0110
Contract AC04-76DP00053

The OH-4 and PA-3 wells provided the first direct comparison of resource assessment methods for estimating free hydrocarbon gas contents in the Devonian shales. For the first time, the pressure core barrel was successfully utilized in a shale formation. A comparison of the three methods of resource assessment indicated that the conventional method employed for most cored wells has provided a significantly conservative estimate of resource and has not provided any offgassing rate data. The pressure core barrel method provided the ultimate in gas resource values; however, the controlled offgassing method employed on these wells provided relevant data. Geochemical analysis of OH-4 and PA-3 samples indicated that the shale in this area is atypical of the Devonian Shale from other Appalachian wells. The shale in these wells is moderately immature and oil prone; however, it has significant hydrocarbon gas content. These characteristics indicate that this shale might be combustion. A conventional mud-logger employed during the drilling had serious shortcomings. (ERA citation 06:034296)

Analysis of Data from Line-Source Thermal-Conductivity Measurements Taken in Situ in Dome Salt at the Avery Island Mine.
D. F. McVey. Aug 81, 79p SAND-81-1232
Contract AC04-76DP00789

In-situ thermal conductivity was measured in dome salt at the Avery Island Mine by use of a line source thermal conductivity probe. The thermal conductivity was determined to be 5.8 W/m-K at about 26 exp 0 C and 5.6 W/m-K at about 31 exp 0 C. Because the influence of contact resistance and two-dimensional effects prevented the temperature rise from attaining the log-time linear asymptote classically used to analyze line source probe data, a new data reduction procedure using parameter estimation techniques was developed. The procedure obtains a least-squares-best-fit of a classic line source integral solution to the non-

linear early time temperature data. In the fit, contact resistance and thermal conductivity are free parameters. The technique removes many of the classic assumptions that restrict the usefulness of line source probes for in situ measurements. (ERA citation 06:035530)

Chemistry of Silica in Cerro Prieto Brines.
O. Weres, and L. Tsao. Feb 80, 19p CONF-7910166-6(Rev.)
Contract W-7405-ENG-48
Symposium on the Cerro Prieto Geothermal Field, Baja California, Mexico, 17 Oct 1979.

The precipitation of amorphous silica from synthetic geothermal brines that resemble the flashed brine at Cerro Prieto was studied. It was found that part of the dissolved silica quickly polymerizes to form suspended colloidal silica. The colloidal silica flocculates and settles slowly at unmodified brine pH values near 7.35. Raising the pH of the brine to about 7.8 by adding base and stirring for a few minutes causes rapid and complete flocculation and settling. These results have been confirmed in the field using actual Cerro Prieto brine. Several commercially available flocculating agents were also tested. Both in the laboratory and in the field, it was found quaternary amines to be effective with some brine compositions but not with others. Polyacrylamides do not work at all. These results suggest the following simple preinjection brine treatment process: age the brine for 10 to 20 minutes in a covered holding tank, add 20 to 30 ppm lime (CaO), stir for 5 minutes, and separate the flocculated silica from the brine using a conventional clarifier. The brine coming out of such a process will be almost completely free of suspended solids. The pilot plant tests needed to reduce this conceptual process to practice are discussed. In a separate study, the rate of deposition of silica scale from synthetic brines was researched. It was found that a modest decrease in pH could significantly reduce the scaling rate at a reasonable cost. (ERA citation 05:028856)

Intersecting Faults and Sandstone Stratigraphy at the Cerro Prieto Geothermal Field.
S. Vonder Haar, and J. H. Howard. Feb 80, 15p CONF-7910166-11
Contract W-7405-ENG-48
Symposium on the Cerro Prieto Geothermal Field, Baja California, Mexico, 17 Oct 1979.

The northwest-southeast trending Cerro Prieto fault is part of a major regional lineament that extends into Sonaro and has characteristics of both a wrench fault and an oceanic transform fault. The distribution of lithologies and temperature within the field was studied by comparing data from well cuttings, cores, well logs, and geochemical analyses. Across the earliest developed portion of the field, in particular along a 1.25-km northeast-southwest section from well M-9 to M-10, interesting correlations emerge that indicate a relationship among lithology, microfracturing, and temperature distribution. In the upper portion of Reservoir A of this stratigraphic section, between 1200 and 1400 m, the percentage of sandstones ranges from 20 to 55. Temperatures are 225 exp 0 to 275 exp 0 C based on well logs, calcite isotope maxima, and Na-K-Ca indices. The study shows that an isothermal high in this vicinity corresponds to the lowest total percentage of sandstones. Scanning electron microphotographs of well cores and cuttings from sandstone and shale units reveal clogging, mineral dissolution, and mineral precipitation along microfractures. The working hypothesis is that these sandy shale and siltstone facies are most amenable to increased microfracturing and, in turn, such microfracturing allows for higher temperature fluid to rise to shallower depths in the reservoir. (ERA citation 05:032086)

Procedures for Petrophysical, Mineralogical and Geochemical Characterization of Fine-Grained Clastic Rocks and Sediments.
E. B. Nuhfer, J. A. Florence, J. L. Clagett, J. J. Renton, and R. R. Romanosky. Aug 79, 41p
Contract EY-76-C-05-5199

The methods result from about four years of study of shales and recent fine-grained muds and are suitable for rapidly processing large numbers of samples cheaply and quickly with very good precision. Density and porosity measurements sufficient to provide good between-sample comparisons of shales with only about 1 or 2% porosity are possible using equipment found in most laboratories providing that attention is given to sources of small errors and suitable immersion fluids are used. Mineralogical composition can be precisely characterized by x-ray diffraction, providing that a careful sample preparation scheme is adhered to. Such precision can be maintained on samples as small as 20mg in size. Elemental analyses are better performed on high-temperature ash remaining after loss-on-ignition than on original whole sample. Complete chemical analyses of major, minor, and many trace elements can be obtained on sample sizes as small as 20mg of ash. Precision afforded by mineralogical and chemical methodology is sufficient to allow merging of data from these two sources for statistical analyses. Presence of significant amounts of x-ray-amorphous mineraloids is now thoroughly documented in recent muds and is possibly present in many shales. (ERA citation 05:000186)

Hotspots, Polar Wander, Mesozoic Convection and the Geoid.
D. L. Anderson. 10 Nov 81, 19p NASA-CR-164943
Grant NSG-7610
Revised.

The geoid bears little relation to present tectonic features of the earth other than trenches. The Mesozoic supercontinent of Pangea, however, apparently occupied a central position in the Atlantic-African geoid high. This and the equatorial Pacific geoid high contain most of the world's hotspots. The plateaus and rises in the western Pacific formed in the Pacific geoid high and this may have been the early Mesozoic position of Pacifica, the fragments of which are now the Pacific rim portions of the continents. Geoid highs which are unrelated to present subduction zones may be the former sites of continental aggregations and mantle insulation and, therefore, hotter than normal mantle. The pent-up heat causes rifts and hotspots and results in extensive uplift, magmatism, fragmentation and dispersal of the continents and the subsequent formation of plateaus, aseismic ridges and seamount chains. Convection in the uppermantle would then be due to lateral temperature gradients as well as heating from below and would be intrinsically episodic.

The icebreaker collected 36 piston cores and 32 trigger cores from 39 stations. Most cores were taken north of Ross Island, next to the Ross Ice Shelf, and along the 1,000-meter depth north of the Ross Ice Shelf. Longest core is 1,077 centimeters; most are half that length or less. Objectives were to determine the climatic and oceanic history of the region and the west antarctic ice sheet.

Reproducibility of Joint Spacing Measurements in Rock,
V. J. Ewan, G. West, and J. Temporal. c1981, 31p
TRRL-LR-1013
Also pub. as ISSN-0305-1293.

An investigation has been made into the reproducibility of measurement of joint spacing in rock. The rocks studied were sandstone, mudstone and limestone exposed in the Kielder Aqueduct Tunnels; the same limestone exposed in a nearby quarry was also studied. Joint spacing measurements made on site were also compared with measurements made from stereophotographs. It was found that for six observers measuring a 10m long scanline, the number of joints recorded can vary by up to a factor of nearly four without there being any real difference in the joint spacing of the rock. Measurements made from stereophotographs showed more joints than measurements made on site. When the joint spacing results were used to assign the rocks to recognized joint spacing classification categories, the results never varied by more than two adjacent categories, suggesting that the effects of the variation may not be so serious from the engineering classification standpoint. This was confirmed when it was found that the variation does not affect the overall rating of the rock mass using the Bieniawski rock mass classification. (Copyright (c) Crown Copyright 1981.)

Water-Resources Information for the Withlacoochee River Region, West-Central Florida.
Final rept. 1980-1981,
Robert A. Miller, Warren Anderson, Anthony S. Navoy, James L. Smoot, and Roger G. Belles. Aug 81, 143p Rept nos. USGS/WRI-81-11, USGS/WRD/WRI/81-087

The ground-water system in the Withlacoochee River region is comprised of up to three different aquifers--the surficial, the secondary artesian, and the Floridan. Little is known about the surficial and secondary artesian aquifers. The Floridan aquifer consists mostly limestones and dolomites, and is as much as 1,500 feet thick. Transmissivities are known to be as high as 25 million feet squared per day. The quality of water within the Floridan aquifer is generally excellent except in two areas where saltwater is present. The majority of the streams have average dissolved-solids concentrations between 100 and 200 milligrams per liter, maximum-observed specific conductance between 250 and 750 micromhos per centimeter, and average total nitrogen concentrations of less than 1.2 milligrams per liter. Summaries were compiled of more than 1,000 wells, 43 continuous-record gaging stations, 21 lakes, and 46 springs. (Author)

Bottom Heat Transfer to Water Bodies in Winter.
Special rept.,
Kevin O'Neill, and George D. Ashton. Sep 81, 12p
Rept no. CRREL-SR-81-18

In many surface water bodies, water temperature closely follows ambient air temperature. This means that warmer water in winter absorbs heat from below. The extent and pattern of winter heat gain is constrained by the fact that the water temperature does not fall below the freezing point. On the basis of a few simple assumptions, governing equations are solved here pertaining to heat flow in bottom sediments. The results are presented in general nondimensionalized curves. These allow estimation of water/sediment heat flux for any particular case, given truncation of the water temperature curve at the freezing point. The user must supply pertinent yearly air temperature mean and amplitude of variation, together with the thermal diffusivity for the bottom material. The governing equations are solved using a higher order finite element method which solves directly for temperature gradients and hence for heat flux. Thus the method provides particularly accurate flux values at high efficiency. The results illustrate in detail how winter water heat gain is less in cases where mean air temperatures are lower. Limnological Investigations: Lake Koocanusa, Montana. Part 5. Phosphorus Chemistry of Sediments.
Special rept.,
I. K. Iskandar, and S. S. Shukla. Jul 81, 14p Rept no. CRREL-SR-81-15

This study characterizes the sediments from Lake Koocanusa (Libby Dam reservoir), Montana, in terms of their ability to sorb and release P. Sediment samples were collected at 12 stations located between the U.S.-Canadian border and Libby Dam (42 miles downstream of the border) during July 1977. The sediments from Lake Koocanusa are calcareous, low in organic matter (< 2.3%), and have a silty loam or loam texture. Most of the P associated with these sediments was in the inorganic form (> 85%), which was highly correlated (r = 0.89) with oxalate extractable Fe in the sediment. Sorption tests, with concentrations of either 1000 or 10,000 micrograms P/g sediments, showed that these sediments have limited ability to sorb additional P from concentrated solutions. The maximum amount sorbed at the lower P concentrations was 67% of the added P and was highly correlated with oxalate extractable Fe in the sediments. Desorption studies showed that very small amounts of both the originally bound P (1 to 2%) and the added P (< 6.3%) were released. Conclusion: the sediments in Lake Koocanusa act as a P sink. Hydrologic Study of the Unsaturated Zone Adjacent to a Radioactive-Waste Disposal Site at the Savannah River Plant, Aiken, South Carolina.
P. Gruber. 1980, 136p DOE/TIC-11491
Contract AC05-76OR00033
Thesis.

Unsaturated hydraulic conductivity as a function of soil-water content and soil-water pressure head of field soils in the vicinity of a low-level radioactive-waste disposal site was measured for a period of 28 days following steady-state infiltration. Tensiometer and a neutron probe measurements were replicated four times at various depth intervals of from 12.0 to 120.00 inches below land surface in two 12 foot square plots. Values of soil-water content, soil-water flux, and hydraulic conductivity at each depth were calculated during the period of drainage using a computer program called SOIL. After drainage of soil-water through the 120 inch profile ceased, duplicate undisturbed soil cores from opposite sides of each plot and from disturbed and un-

disturbed sites within the burial grounds were recovered and subjected to pressure-plate analysis for the calculation of unsaturated hydraulic conductivity. Laboratory analyses also included the determination of soil bulk density, particle-size distribution, and saturated hydraulic conductivity. Calculation of unsaturated hydraulic conductivity in the laboratory was made using a computer program called HYDRO, based upon the relationship of the soil-water content/soil-water pressure curve. Soils in the study area and the burial ground exhibited similar physical and hydrologic characteristics. Field derived hydraulic conductivity correlated well with laboratory derived conductivity. Variability of soil characteristics due to burial operations were minimal when compared to undisturbed natural soils in the study area. Two textural discontinuities were found to exist in the soil profile at depths of 12 to 24 inches and at 130 inches, which inhibit soil-water movement and thereby reduce the quantity and rate of recharge to the underlying water-table aquifer. Los Alamos Scientific Lab., NM.
Geohydrology of Bandelier National Monument, New Mexico.
W. D. Purtymun, and H. Adams. Jul 80, 28p
Contract W-7405-ENG-36

Bandelier National Monument is located on the eastern slopes of the Sierra de los Valles and the Pajarito Plateau. The Pajarito Plateau was formed by a series of ashflow and ashfall of rhyolite tuff. Perennial and intermittent streams have cut the surface of the plateau into a number of narrow southeast-trending mesas separated by deep canyons. Perennial surface flow occurs in Canon de los Frijoles and in the upper and middle reaches of Alamo, Capulin, Medio, and Sanchez Canyons. Of the five springs in and adjacent to the Monument, three discharge from perched aquifers and two from the main aquifer. Water in the deep main aquifer moves south to southeast in the Monument. Along the western edge of the Monument, the intrusion of volcanic rock of the San Miguel Mountains forms a barrier to the movement of water from the recharge area in the Valles Caldera. About 46.4 km exp 2 of the drainage area in the upper and middle reaches of Canon de los Frijoles, Alamo, Lummis and Capulin Canyons were burned over by a wildfire (the La Mesa Fire) in June 1977. The geohydrology of the area was determined to assess the availability of surface and ground water in the Monument and to determine the impact of the wildfire on these water resources. Borehole Data-Collection Methods Applicable for the Regional Observation and Monitor Well Program, Southwest Florida Water Management District.
Water-resources investigations,
John J. Hickey. Sep 81, 16p USGS/WRD/WRI-81-093, USGS/WRI-81-57
Prepared in cooperation with Southwest Florida Water Management District, Brooksville.

Management of ground-water resources within the Southwest Florida Water Management District requires that hydrogeologic characteristics of water-bearing rocks and quality characteristics of water be described. Wells for the District's Regional Observation and Monitor Well Program are drilled specifically to collect data to describe the groundwater resource. Borehole data-collection methods for these wells include drilling in stages; running geophysical logs at the completion of each stage; collection of water-level and specific-conductance data before, during, and after a day's drilling; specific-capacity determinations after a day's drilling; and placing a packer in the gypsiferous and anhydritic limestone and dolomite for water-level and water-quality data.

Mean Annual Streamflow of Selected Drainage Basins in the Coal Area of Southeastern Montana.
Water-resources investigations (Final),
Rodger F. Ferreira. Oct 81, 28p USGS/WRD/WRI-81-097, USGS/WRI-81-61
Prepared in cooperation with Bureau of Land Management, Washington, DC., and Environmental Protection Agency, Washington, DC.

Streamflow characteristics of drainage basins within the Fort Union coal region of southeastern Montana were estimated to provide premining data for evaluating the future effects of mining on the environment. Estimated annual mean streamflow at 22 data-collection stations for water years 1975-77 ranged from 0 to 887 cubic feet per second. These estimates are based on miscellaneous-streamflow records at each station and continuous-streamflow records from other stations in the study area. Estimated mean annual streamflow for a 10-year period (water years 1968-77) ranged from 0 to 572 cubic feet per second. Many of the drainage basins had a mean annual runoff of less than 0.60 inch; the maximum observed mean annual runoff was 4.45 inches.

Geological Survey, Lawrence, KS. Water Resources Div.
Selected Hydrologic Relationships for Soldier Creek, Northeastern Kansas.
Water-resources investigations (Final),
William J. Carswell, Jr. Apr 81, 69p USGS/WRD/WRI-81-099, USGS/WRI-81-8

Prepared in cooperation with Kansas Water Resources Board, Topeka.

Hydrologic data from Soldier Creek basin were compared with relations from statewide data. The quantity and quality of streamflow were affected mostly by soils, slopes, and land use. Average annual precipitation during the study (1964-76) was 35.12 inches, or 2.3 percent greater than the long-term (1929-76) average. The average streamflow in Soldier Creek at Topeka, Kansas, was 23 percent greater than the long-term average. In general, frequency curves of annual peak discharges compared poorly with curves from statewide relations due to the absence of extremely low peaks during the short period.

Comments on Interior's Surface Mining Regulations.
5 Aug 81, 18p Rept no. GAO/CED-81-145

The General Accounting Office has been reviewing the Office of Surface Mining Reclamation and Enforcement (OSM), Department of the Interior, regulations implementing the Surface Mining Control and Reclamation Act of 1977 (Public Law 95-87). We initiated this review to follow-up on our September 21, 1979, report entitled 'Issues Surrounding the Surface Mining Control and Reclamation Act' (CED-79-83) and because of congressional, State, industry, and public interest and controversy in controlling and reclaiming coal surface mined areas. OSM is in the process of making major revisions to its regulations and we, therefore, do not plan further work at this time. However, during our regulatory analysis of seven regulations and discussions with various officials, we identified issues which we are suggesting OSM consider while revising its regulations. Our objective was to determine if key regulations provided adequate environmental protection while allowing States and coal mine operators sufficient flexibility to choose the appropriate methods necessary to achieve the Act's environmental goals at the least cost. Our review consisted of interviewing officials of four State natural resource agencies (Colorado, Pennsylvania, West Virginia, and Wyoming), four coal associations, two coal companies, two environmental groups, one bonding association, the National Academy of Sciences, the Environmental Protection Agency, the Bureau of Mines, and OSM.

Integration, Interpretation and Evaluation of Results in a Multi-Well Interference Test Project. Quarterly Financial Summary and Monthly Technical Report.
J. Alam. 8 Sep 81, 64p DOE/MC/16823-T1
Contract AC21-78MC16823

The objectives of this project are to analyze interference test data in order to determine in situ flow properties of Devonian shale reservoirs. Preliminary analysis of build-up interference test data and drawdown test data for all the zones is summarized. The drawdown interference data have been analyzed in order to identify the matrix influence and quantify its properties which are then used in quantifying key parameters. Preliminary analysis of the interference test data indicates pseudo-steady state (quasi-steady-state) gas transport in the matrix. The approximate fracture storage coefficient and dimensionless fracture transfer coefficient from the bottom zone of well number 10056B were calculated as 10 exp -1 to about 10 exp -2 , and 4.0 x 10 exp -8 , respectively. Project to Develop and Demonstrate Methods to Eliminate Frozen-Coal-Handling Problems. Status Report IV.
Sep 81, 18p DOE/PC/30076-T3
Contract AC22-80PC30076

A description is presented of an investigation leading to solutions to the frozen coal problems occurring during winter months. Tests will be carried out in a test facility to evaluate those engineering parameters essential to the design, development, and demonstration of the most effective, economical, and environmentally acceptable method for fracturing frozen coal. The tests carried out during the initial feasibility study will provide the data and optimal procedures necessary for the implementation of a field test program to verify the acceptability and to demonstrate the commercial feasibility of the most effective methods or systems. The costs and benefits that will accrue from the new technology will be determined. To accomplish the goal of finding acceptable solutions to frozen coal problems, it will be necessary to bring forth the best possible technology available to get the job done. In pursuit of this objective, United Coal Company has initiated a comprehensive survey and search to gather all known data and information relative to the subject of frozen coal, as well as methods - both mechanical and chemical - that have been employed to date in attacking the problem. Extensible Bridge-Conveyor Concepts for Coal-Mine Face Haulage. Final Technical Report as of 21 April 1981.
J. C. Swain, D. L. Thomas, and E. C. Mullen. 1981, 87p DOE/ET/14210-T1
Contract AC01-79ET14210

The objective of the work reported herein was to develop design concepts for extensible bridge conveyors which can be used in multiples to form a continuous haulage system. Consultation services were provided by Jeffrey Mining Machinery Division on mining technology and B.F. Goodrich Engineered Systems Division on conveyor belt technology. Additional information was gathered in a mine visit, during visits to conveyor manufacturers, and contacts with several component suppliers. From a group of 20 machinery arrangement concepts, three extensible conveyor approaches were selected and machinery arrangement and internal detail drawings were prepared for each. Two of the concepts are for a face haulage system in which separate nonconnected extensible conveyors are individually trammed into position to form a continuous haulage system. The third concept is for a connected extensible system similar to existing continuous face haulage systems but employing extensible rather than fixed-length bridges. Cost estimates were prepared for the three concepts. The concepts developed employ belt-type conveyors, however, chain-type conveyors were considered to be a viable alternative. (ERA citation 06:034258)

Contract AC13-76GJ01664
Includes 6 sheets of 48x reduction microfiche.

During the months of July and August of 1980, Aero Service Division Western Geophysical Company of America conducted an airborne high sensitivity gamma-ray spectrometer and magnetometer survey over eleven (11) 3 exp 0 x 1 exp 0 and one (1) 4 exp 0 x 1 exp 0 NTMS quadrangles of the Alaska North Slope. These include the Barrow, Wainwright, Meade River, Teshekpuk, Harrison Bay, Beechey Point, Point Lay, Utukok River, Lookout Ridge, Ikpikpuk River, Umiat, and Sagavanirktok quadrangles. This report discusses the results obtained over the Harrison Bay map area. (ERA citation 06:034327)

Effects of Gas-Flow Pattern on Cavity Shape.
J. R. Creighton. 22 Jul 81, 16p UCRL-85907, CONF-810923-10
Contract W-7405-ENG-48
Underground coal conversion symposium, Fallen Leaf Lake, CA, USA, 8 Sep 1981.

The effects of different gas flow patterns on the cavity shape in laboratory scale coal block experiments are shown. For simplicity, the burning of pure carbon, rather than coal is modeled. The rate of removal of carbon from the cavity wall is shown to depend on the local rate of oxygen transport to the wall. A numerical model which assumes plug flow in the cavity with a laminar boundary layer gives cavities shaped like an exponential horn, with the largest radius next to the inlet. The downstream shape is in reasonable agreement with experiment but the upstream shape differs. When the flow in the cavity is calculated using the full Navier-Stokes equations the flow near the inlet resembles an expanding jet surrounded by a torroidal vortex. The maximum rate of oxygen transport to the wall occurs where the jet strikes the converging cavity wall some distance downstream. The reduced oxygen transport near the inlet causes the upstream portion of the cavity to be rounded, in agreement with experiment. The downstream portion of the cavity is similar to that with plug flow. (ERA citation 06:034223)

Investigation of Factors Affecting the in-Situ Combustion Retorting of Oil Shale. Final Report.
H. Y. Sohn. 29 May 81, 166p DOE/ET/13095-T1
Contract AS03-78ET13095

The objective of this research was to carry out an experimental and analytical investigation of a number of subprocesses taking place during an in situ combustion retorting of oil shale. Some of these subprocesses also occur in a surface retorting process. The specific

topics of this research program include: (1) experimental determination of the intrinsic kinetics of kerogen decomposition producing oil; (2) mathematical formulation of the retorting of an oil shale block in the presence of heat transfer effects; (3) experimental determination of the intrinsic kinetics of oil shale char oxidation; (4) mathematical modeling of the oxidaton of oil shale char in a spent shale block in the presence of heat and mass transfer effects; (5) determination of ignition delay and energy requirements for the ignition of an oil shale bed; (6) determination of thermal expansion of oil shale; and (7) determination of heat capacities of oil shale and the heat of decomposition of kerogen. The results of the investigation of these topics are presented. Some of the results have been published in journals which are readily available. In such a case only a brief summary of the results are presented. (ERA citation 06:034309)

Formation Evaluation in Liquid-Dominated Geothermal Reservoirs.
I. Ershaghi, E. E. Dougherty, and L. L. Handy. Apr 81, 106p
Contract AT03-76ET28384

Studies relative to some formation evaluation aspects of geothermal reservoirs are reported. The particular reservoirs considered were the liquid dominated type with a lithology of the sedimentary nature. Specific problems of interest included the resistivity behavior of brines and rocks at elevated temperatures and studies on the feasibility of using the well log resistivity data to obtain estimates of reservoir permeability. Several papers summarizing the results of these studies were presented at various technical meetings for rapid dissemination of the results to potential users. These papers together with a summary of data most recently generated are included. A brief review of the research findings precedes the technical papers. Separate abstracts were prepared for four papers. Five papers were abstracted previously for EDB. (ERA citation 06:034642)

Alaska: A Guide to Geothermal Energy Development.
N. Basescu, R. G. Bloomquist, C. Higbee, D. Justus, and S. Simpson. Jun 80, 125p
Contract AS06-77ET28476

A brief overview is given of the geological characteristics of each region of the state as they relate to potential geothermal development. Those exploration methods which can lead to the siting of a deep exploration well are described. Requirements and techniques needed for drilling deeper higher temperature exploration and production wells are presented. Electrical generation, direct utilization, and indirect utilization are reviewed. Economic factors of direct use projects are presented. A general guide to the regulatory framework affecting geothermal energy development is provided. The general steps necessary to gain access to explore, develop, distribute, and use geothermal resources are outlined. (ERA citation 05:032066)

Near-Surface Moisture and Biomass Influences on the Reliability of Aerial Radiometric Surveys as a Measure of Natural Radioelement Concentrations.
J. R. Norwine, D. J. Hansen, D. F. Saunders, and J. H. Galbraith. 28 Sep 79, 151p
Contract AC13-76GJ01664

Significant differences in aerial radiometric system calibration constants in humid-forested (Portland quadrangle) and desert (Lake Mead test strip) regions indicated the probability of substantial gamma-ray absorption by soil moisture in humid areas. A set of test quadrangles was selected to investigate relationships among a group of environmental variables and ratios of whole-quadrangle mean (X) stream sediment uranium (U) and thorium (Th) contents to corresponding mean aerial radiometric uranium and thorium measurements. It was assumed that stream sediment values might be sufficiently representative of the average surface radioelement concentrations to be used in ground-calibrating the aerial systems. Preliminary testing established strong statistical correlations between the radioelement ratios and moisture and biomass variables. However, it is recognized that moisture and biomass relationships represent a variety of variables affecting the aerial gamma-ray measurements, such as soil formation, including weathering effects. Also, the data suggested that in certain very humid areas placering effects caused the mean thorium and uranium content of stream sediments to be much greater than actual concentrations in the average surface rocks. These effects appeared to be minimal in the arid regions, where the stream sediment data were more representative of the surface materials in general. These observations prompted a follow-up study using surface-to-aerial ratios based on analyses of surface samples in humid regions and including the stream sediment-to-aerial data ratios only for the relatively arid areas. Multiple linear regression analyses of the data indicated two-variable models would provide reasonable correction factors for aerial data obtained in humid environments. (ERA citation 05:030232)

Aerial gamma Ray and Magnetic Survey: Mississippi and Florida Airborne Survey, Springfield Quadrangle of Missouri. Final Report.
Jun 80, 234p
Contract AC13-76GJ01664

The Springfield quadrangle of southern Missouri contains a portion of the Ozark Uplift. Near-surface Precambrian rocks are almost completely covered in this area by a thin veneer of Paleozoic carbonates. The region has undergone recent uplifting. Several faults cut through the Paleozoic section but show no extreme displacement. Examination of available literature shows no known uranium deposits (or occurrences) within the quadrangle. Fifty-six groups of uranium samples were defined as anomalies and discussed briefly. None were considered significant, and most appeared to be of cultural origin. Magnetic data were influenced largely by the underlying Precambrian. The structure and lithology of the Precambrian is apparently complex, and suggests that some surface faults may extend into the basement material. (ERA citation 05:031635)

Aerial gamma Ray Amd Magnetic Survey: Mississippi and Florida Survey, Meridian Quadrangle of Mississippi and Alabama. Final Report.
Jul 80, 323p
Contract AC13-76GJ01664

The Meridian quadrangle of Alabama and Mississippi lies on the northeastern edge of the Gulf Coastal Physiographic Province. The structure of the area is complex, with thick wedge of Mesozoic and Cenozoic sediments covering the northwesterly-trending Ouachita Tectonic Zone, and the northeasterly-trending Appalachian Front. Cretaceous rocks are exposed in the northeast, whereas the balance of the quadrangle contains exposures of Tertiary and Quaternary sediments. Examination of available literature shows no known uranium deposits in the quadrangle. One hundred groups of uranium samples were defined as anomalies and discussed briefly in this report. One group of anomalies in Cretaceous rocks was considered as being possibily significant. Most of the remaining anomalies appeared to be of cultural origin. Magnetic data suggests deep-seated magnetic sources, and at the map scale, are not realistically correlatable with known sedimentary structures. (ERA citation 05:031640)

Aerial gamma Ray and Magnetic Survey: Mississippi and Florida Airborne Survey, Hattiesburg Quadrangle of Mississippi, Alabama, and Louisiana. Final Report.
Jul 80, 279p
Contract AC13-76GJ01664

The Hattiesburg quadrangle of Mississippi, Alabama, and Louisiana lies in the northern Gulf coastal Physiographic Province. The region overlies a portion of the intersection the Ouachita Tectonic Belt and the Appalachian Front, but is covered with a substantial thickness of sediments post dating the orogenic periods. Several faults and a minor flexure zone cut across the northeastern quadrant. Examination of available literature shows no known uranium deposit within the quadrangle. Seventy-four groups of uranium samples were defined as anomalies and are discussed briefly. None were considered significant, and most appeared to be of cultural origin. Magnetic data showed extremely low gradients, and suggest deep-seated magnetic sources. Relatively higher gradients in the fault/flexure zone suggest slightly shallower sources in this area. (ERA citation 05:031641)

Aerial Radiometric and Magnetic Reconnaissance Survey of Portions of Arizona--New Mexico, Mesa Quadrangle.
Nov 78, 333p
Contract EY-76-C-13-1664

The results of a high-sensitivity aerial gamma-ray spectrometer and magnetometer survey of the Mesa Quadrangle, Arizona, are presented. Statistical and geological analysis of the radiometric data revealed 110 uranium anomalies worthy of field checking as possible prospects. Sixty-three anomalies suggest the presence of vein-type uranium in acid igneous rocks of Tertiary to Mesozoic age. Twenty-three anomalies are related to Precambrian granites and three to Precambrian schists. The Dripping Spring Quartzite, which has the greatest possibility for mineralization in the Mesa Quadrangle, is associated with 16 anomalies. Six anomalies may indicate uranium mineralization in the potentially favorable Supai Formation in the northeastern part of the quadrangle. The presence of possible stratiform uranium deposits in basins is indicated by 35 anomalies in rocks varying in age from Quaternary to Cretaceous. Ranges appearing most favorable for uranium mineralization include Humbolt Mountain, West Granite-Herder Mountains area, Pine Mountain--Four Peaks area, Fish Creek--Iron Mountains area, Dripping Spring--Tortilla-Mescal Mountains zone, west side of Gila Mountains, Sierra Ancha, and east of the Sierra Ancha. EG and G GeoMetrics, Sunnyvale, CA.
Aerial gamma Ray and Magnetic Survey: Idaho Project, Ogden Quadrangle, Utah and Wyoming. Final Report.
Dec 79, 414p
Contract EY-76-C-13-1664

The Ogden quadrangle in northeastern Utah and southe western Wyoming contains portions of the Green River Basin, the Wasatch-Teton Line, and the Sevier overthrust belt. A small percentage of the quadrangle along the western edge lies within the Basin-Range Province. Tertiary nonmarine sediments dominate the surface of the quadrangle, grading into tightly folded Mesozoic and Paleozoic sediments and Precambrian crystalline rock in the uplifted regions of the west. Laramide thrust faults and younger normal faults have contributed significantly to the present set of exposures and the topography of the area. Magnetic data apparently show dominantly deep sources except in the Wasatch-Bear River Mountain chains where crystalline basement is partially exposed. The Ogden quadrangle has been unproductive in terms of uranium mining. No claims were found by examination of known literature sources. A total of 255 anomalies are valid according to the criteria set forth in Volume I. The anomalies are scattered throughout the quadrangle. One well-defined group has peak concentrations in the range of 10.0 ppm eU or greater. Some anomalies in this group show obvious signs of recent surveying and/or development on flight recovery film. (ERA citation 05:020111)

Western Geophysical Co. of America, Houston, TX. Aero Service Div.
Airborne gamma-Ray Spectrometer and Magnetometer Survey: Norton Bay Quadrangle (Alaska). Final Report.
Jan 80, 104p
Contract EY-76-C-13-1664

During the months of July, August, and September 1979, an airborne high sensitivity gamma-ray spectrometer and magnetometer survey was conducted over ten 3 exp 0 x 1 exp 0 NTMS quadrangles of West-Central Alaska. The results obtained over the Norton Bay Map area are discussed. The final data are presented in four different forms: on magnetic tape; on microfiche; in graphic form as profiles and histograms; and in map form as anomaly maps and flight path maps. The histograms and the multiparameter are presented with the anomaly maps and flight path map in a separate volume. A total of twenty (20) uranium anomalies have been indicated on the interpretation map. No thorium anomalies were found. The uranium anomalies are all weak and generally have only U/K or U/T expression. Often the uranium concentration within the zone is low, and generally is less than 2.5 ppM. Only zones 9, with an average of 3.0 ppM eU, and 14, with 2.6 ppm have above average uranium content. Zone 14 is also the only uranium anomaly with combined U/K and U/T ratio anomalies. No single uranium anomaly is believed to represent an economic follow-up target. The most prospective area appears to be the elongate zone of generally high uranium content, formed by the deposits of the Shaktolik group, to the east of the Ungalik conglomerate. This zone flanks an elongate area of relatively strong shallow magnetic sources, interpreted to be related to a monozonitic intrusive of which the Christmas mountain forms part. This intrusive rock contains in other neighboring areas often high thorium and uranium concentrations and may here as well served as a possible source of uranium deposits. (ERA citation 05:021830)

Airborne gamma-Ray Spectrometer and Magnetometer Survey: Medfra Quadrangle (Alaska). Final Report.
Mar 80, 97p
Contract EY-76-C-13-1664

During the months of July, August, and September 1979, an airborne high sensitivity gamma-ray spectrometer and magnetometer survey was conducted over ten 3 exp 0 x 1 exp 0 NTMS quadrangles of West-Central Alaska. The results obtained over the Medfra map area are discussed. The final data are presented in four different forms: on magnetic tape; on microfiche; in graphic form as profiles and histograms; and in map form as anomaly maps, flight path maps, and computer printer maps. The histograms and the multiparameter profiles are presented with the anomaly maps and flight path map in a separate volume. Results from the geochemical analysis indicate that the formation with the highest number of uranium anomalies is the Quarternary alluvium with 34. The geologic formation believed to be the most promising for possible uranium enrichment in the Medfra Quadrangle appears to be unit Tg, Tertiary granitic rocks. By using the criteria outlined in the general section on interpretation, a total of 58 uranium anomalies have been outlined on the interpretation map. Based in part on the criteria discussed in the general interpretation section and in part on the thorium pseudo-contourmap, a total of twelve thorium anomalies have been outlined. Many of the 58 uranium anomalies outlined consist only of anomalous responses of only one of the two uranium/potassium and uranium/thorium ratios, with the other ratio being either normal or anomalous due to very low thorium or potassium values, and with little or no expression on the uranium anomaly map. (ERA citation 05:021835)

Research within the Coordinated Progamme on Bacterial Leaching of Uranium Ores. Final Report for the Period 1 March 1972 - 31 October 1977.
D. Marjanovic. Jan 78, 51p
U.S. Sales Only.

Effect of magnetic field on the growth rate of Thiobacillus ferrooxidans bacteria was studied at intensities of 30, 100, 2400, and 4000 Oe. Low intensity magnetic field was found to stimulate the bacteria growth rate and the rate of ferrosulphate oxidation with optimum values at 30 to 300 Oe (maximum at 300 Oe). Magnetic field of high intensity (2400, 3200, 4000 Oe) inhibits the growth of bacteria and processes of bacterial oxidation. The possibility was also studied of using biocides for inhibiting bacterial processes in uranium-bearing waste dumps. The use of biocides resulted in a decrease of uranium-bearing waste dump autochthonous microflora density. (Atomindex citation 11:507891)

Neutron-Capture gamma-Ray Analysis of Coal for Sulfur, Iron, Silicon and Moisture.
D. A. Fay. May 79, 135p
Contract W-7405-ENG-82
Thesis.

Samples of coal weighing approximately 200 grams placed in a collimated beam of neutrons from the thermal column of the Ames Laboratory Research Reactor produced capture gamma-rays which could be used for the simultaneous determination of sulfur and iron. Spectra from NaI(Tl) and Ge(Li) detectors were used and interferences were located by examining spectra of the major elemental components of coal. In determining sulfur, iron is a potential source of interference when gamma-ray spectra are collected with a NaI(Tl) detector. Corrections for iron interference were made by use of a higher energy iron peak. The possibility of determining silicon in coal was investigated but this element determination was unsuccessful since capture gamma-ray spectrometry lacked the necessary sensitivity for silicon. A linear relation was found between the area of the hydrogen capture peak at 2.23 MeV and the amount of water added to coal. (ERA citation 04:054061)

Contract W-7405-ENG-36
Geothermal Resource Council annual meeting, Salt Lake City, UT, USA, 9 Sep 1980.

The Los Alamos Scientific Laboratory has been investigating a large area in New Mexico for Hot Dry Rock geothermal potential. The area includes parts of the Jemez volcanic lineament and the central Rio Grande rift. LASL has completed a detailed magnetotelluric/audiomagnetotelluric survey covering 161 square km over an area of high heat flow, south of Zuni, NM. The data collection was collected and preliminary analysis phases of a regional MT survey which suggest the Jemez lineament is associated with a crustal structure of anomalously high electrical conductivity. The detailed MT shows an average tipper strike of N60 exp 0 E above 100 sec period, representing the structural trend within Precambrian basement. The Jemez lineament strikes approximately N55 exp 0 E; this suggests a relationship between the Precambrian structure beneath the Zuni area and the Jemez lineament. (ERA citation 05:032093)

Directional Drilling Equipment and Techniques for Deep Hot Granite Wells.
T. L. Brittenham, G. Sursen, J. W. Neudecker, J. C. Rowley, and R. E. Williams. 1980, 10p CONF-800931-3
Contract W-7405-ENG-36
55. Society of Petroleum Engineers of AIME annual technical conference and exhibition, Dallas, TX, USA, 21 Sep 1980.

Conventional directional drilling technology has been extended and modified to drill the first well of a subsurface geothermal energy extraction system at the Fenton Hill, New Mexico, Hot dry Rock (HDR) experimental site. Completing the first of a two-wellbore HDR system has resulted in the definition of operational limitations of many conventional directional drilling tools, instrumentation and techniques. The successful completion of the first wellbore, Energy Extraction Well No. 2 (EE-2), to a measured depth of 15,300 ft (4.7 km) in granite reservoir rock with a bottomhole temperature of 530 exp 0 F (275 exp 0 C) required the development of a new high temperature downhole motor and modification of existing wireline-conveyed steering tool systems. Conventional rotary-driven directional assemblies were successfully modified to accommodate the very hard and abrasive rock encountered while drilling nearly 8500 ft (2.6 km) of directional hole to a final inclination of 35 exp 0 from the vertical at a controlled azimuthal orientation. (ERA citation 05:032119)

Location of Hydraulic Fractures Using Microseismic Techniques.
J. A. Albright, and C. F. Pearson. 1980, 19p CONF-800931-2
Contract W-7405-ENG-36
55. Society of Petroleum Engineers of AIME annual technical conference and exhibition, Dallas, TX, USA, 21 Sep 1980.

Microearthquakes with magnitudes ranging between -6 and -2 have been observed in three successive massive injections of water at the Hot Dry Rock Geothermal Energy demonstration site at Fenton Hill, New Mexico. The injection was part of a program to increase the heat transfer area of hydraulic fractures and to decrease the flow-through impedance between wells. The microearthquakes were used in mapping the location of the extended hydraulic fractures. A downhole triaxial system positioned approximately 200 m vertically above the injection point in a shut-in production well was used for detection. The microearthquakes occurred in a north-northwest striking zone 400 m in length passing through the injection point. During a third substantially larger injection, microearthquakes occurred in a dispersed volume at distances as great as 800 m from the zone active in the first two injections. Kinetic Behavior of Subbituminous Coal Drying; Effects of Confining Pressure.
L. F. Brown, B. A. Kashiwa, N. E. Vanderborgh, and R. C. Corlett. 1980, 10p CONF-800710-1
Contract W-7405-ENG-36

Drying '80 conference, Montreal, Quebec, Canada, 7 Jul 1980.

A model is developed which explains the drying behavior of a subbituminous coal. This model, a variation of the moving-boundary approach, has the vapor-liquid interface in the macropores receding from the exterior surface of the coal as drying progresses. On the liquid side of the interface, liquid water exists in all three pore systems - macropores, transitional pores, and micropores. On the vapor side of the interface, in the transitional and micropore systems branching off the macropores, the moisture essentially is in equilibrium with the water vapor in the macropore system. Water diffuses from the liquid interface in the macropores through these pores to the exterior surface of the coal. Experiments with a Washington State subbituminous coal are described which test this model. The predictions of the model match the behavior of experimental drying curves. The effective diffusivities obtained were within the range expected for the constricted pore systems which coal possesses. Higher initial stresses apparently decrease the total porosity and increase the severity of pore constrictions. Disparities between model prediction and experimental behavior, which occurred at a late drying time, result from the assumed water adsorption isotherm. (ERA citation 05:023541)

Water Availability for Development of Major Tar Sands Areas in Utah.
T. N. Keefer, and R. S. McQuivey. May 79, 252p
Contract EW-78-S-20-0013

The Sutron Corporation, under contract with Colorado State University, has conducted a study for the Laramie Energy Technology Center (LETC) to determine the availability of water for future extraction of viscous petroleum (bitumen) from the six major tar sands deposits in Utah. Specifically, the areas are: Asphalt Ridge and Whiterocks, which lie immediately west of Vernal, Utah; P.R. Spring, a large area extending from the Colorado River to the White River along Utah's eastern border; Hill Creek, adjacent to P.R. Spring to the west; Sunnyside, immediately across the Green River from Hill Creek between the Price and Green Rivers; and Tar Sand Triangle, near the confluence of the Colorado and Dirty Devil Rivers. The study, conducted between September and December of 1978, was a fact-finding effort involving the compilation of information from publications of the US Geological Survey (USGS), Utah State Engineer, Utah Department of Natural Resources, and other federal and state agencies. The information covers the general physiographic and geologic features of the total area, the estimated water requirements for tar sands development, the availability of water in each of the six areas, and the legal and sociological restraints and impacts. The conclusions regarding water availability for tar sands development in each of the six areas and specific recommendations related to the development of each area are presented also. Proceedings of the Second Annual Methane Recovery from Coal Beds Symposium.
R. L. Wise. Apr 79, 243p

Topics covered include methane recovery from coal seams by vertical drilling and by long horizontal drill holes in the seam. Preliminary degassing of the deeper seams may be necessary for safety and productivity in mining them. The recovery of the methane represents the conservation of a resource now largely wasted by venting in mine ventilation air and, in some cases, the economics are favorable. Resource assessment is being carried out and drilling equipment designed for coal seam degassing is described. Seventeen papers from the proceedings have been entered individually into EDB and ERA. (ERA citation 05:011146)

Coal Mine Labor Productivity: Mine-Level Data from Pike County, Kentucky, and Other Selected Counties.
R. J. Gaston, J. G. Baker, R. C. Bishop, and L. M. Blair. Jul 80, 51p
Contract AC05-76OR00033

The mine-level examination of Pike County and other selected counties generally supports and nowhere contradicts the state-level and mine-level results obtained by Baker for Illinois and Ohio. In addition, the mine-level data from DOE's Coal Information System allows the examination of the influence of price per ton on individual mine productivity. In general, price had a significant negative effect, both with the pooled and cross-sectional data. The influence of mine turnover on productivity and other mine characteristics was also examined with the DOE Coal System data. The results gave virtually no support to the hypothesis that less efficient mines entering in a period of high prices contributed to depressed average labor productivity. (ERA citation 05:033232)

Coal Cooperative Efficiency Program: Small Mine Operations.
Final rept.,
John Multcher. Sep 80, 311p ARC-77-203-5897

This study researched the concept of small coal operators combining to form a coal cooperatives as a means of providing services and to improve their economic position in coal markets. A small coal operators attitude survey was completed in Appalachia, along with actual interviews of numerous operators in two case study areas--Clearfield, Pennsylvania, and Beckley, West Virginia. A profile of small operator facilities and operations was developed along with suggested coal cooperative configurations in the two case study areas. A general administrative services co-op was suggested for the Beckley area and a capital intensive coal processing/transloading co-op for the Clearfield area. From a review of the vast experience in U.S. agricultural cooperatives a step-by-step procedure for forming a coal co-op is detailed from the idea stage to the first Board of Director's meeting. An extensive economic analysis is included to demonstrate potential member benefit-costs. Recommendations are made to operator, state, regional and federal sectors to develop demonstration coal cooperatives to further prove out the concept.

Multivariable Control of a Milling Circuit at East Driefontein Gold Mine,
D. G. Hulbert, and M. Braae. 14 Aug 81, 57p NIM-2113, ISBN-0-86999-545-6

In an investigation into the control of an industrial milling circuit, a preliminary study was made with the use of a computer simulation. Step tests were then carried out on the plant, and the data obtained were used for the derivation of a linear dynamic model. A multivariable controller was designed for the plant by a suite of interactive computer programmes that included the use of techniques involving the inverse Nyquist array. This controller was successfully applied to the plant by digital computer, and there was very good agreement between the theoretical predictions and the practical application of the controller. The quality of control was also good. While the control scheme involves local control of sump levels and cascade control of feed rates, the most important of the variables that can be controlled to any practically feasible operating points are the flow and density of the feed to the primery cyclones, and the product size, which can be measured online.

The Investigation of a Fracture on One Side of a Skip Bridle in a Mine Shaft,
D. D. Howat. 7 Aug 81, 22p NIM-2110, ISBN-0-86999-543-X

Component sections from the fractured side of a skip bridle were submitted to the National Institute for Metallurgy for examination. The fracture had occurred at the junction of the side of the bridle with the top crosshead. Examination indicated that the fracture had resulted from the combined effect of impact on the side of the bridle by the base of the hook and severe corrosion by acid mine water. Certain aspects of the design are commented upon, and suggestions are made as to modifications that might prevent the recurrence of such a fracture. Modifications to the design of the skip bridle, as proposed by the resident engineer of the mine, are described in an appendix.

D. R. Tesarik, and P. C. McWilliams. Oct 81, 110p BUMINES-RI-8564

The factor of safety, the traditional measure of stability for earth embankments, is graphically presented in factors of safety charts in this Bureau of Mines report. Factor of safety contours are drawn for homogeneous earth embankments for two contrasting situations: (1) no phreatic surface and (2) a phreatic surface that assumes 10-pct freeboard. The factor of safety can be read directly from the charts if the physical properties of the soil and the geometry of the embankment are known. The curves provide a quick first approximation of the 'most stable' and 'least stable' condition of the embankment. The Simplified Bishop Method was used for the safety factor calculations, and a sequence of least squares curve fitting steps was used to present the factor of safety in final chart form.

Water Jet Perforation: A New Method of Completing and Simulating In situ Leaching Wells.
Rept. of investigations,
George A. Savanick, and Walter G. Krawza. Oct 81, 37p BUMINES-RI-8569

The Bureau of Mines has designed, fabricated, and field tested a water jet cutting device capable of perforating nonmetallic well casings for the purpose of completing or stimulating in situ uranium leaching wells. The device is lowered into the wellbore, where it issues a high-velocity water jet that penetrates either a polyvinyl chloride or fiberglass casing, cement, and from 1 to 4 feet into the surrounding uraniferous sandstone. The resulting perforations allow leaching solution to pass between the sandstone and the wellbore. This report describes the water jet perforator, tells how it is used, presents cost data, and discusses the results of laboratory and field tests. The tests were designed to (1) determine the optimum operating conditions for water jet perforation, (2) assess the effects of changes in these conditions, (3) evaluate the performance of the water jet perforator under actual conditions, and (4) compare this method with other methods of well completion. These tests showed that water jet perforation is superior to conventional well completion methods for selectively achieving communication between the wellbore and adjacent sand while maintaining sand control, for restoring permeability lost through wellbore damage, for stimulating poorly performing wells for completing wells with casings that have inside diameters as small as 2 inches, and for extending the effective well diameter.

The Water Spray Cooler - An Update.
Technical progress rept.,
Edward D. Thimons, and J. Harrison Daniel. Oct 81, 14p BUMINES-TPR-114

The water spray cooler is a direct-contact air-to-water heat exchanger designed to cool the hot working areas of deep mines. This cooler was originally developed by the Bureau of Mines. Recent tests with water spray coolers at the Homestake gold mine in South Dakota proved their thermal performance to be superior to that of the conventional finned coil coolers in use at the mine. Testing has also shown that water spray coolers require little maintenance, whereas finned coil coolers need maintenance for dust removal every 2 weeks.

Technical and Economic Evaluation of Mine Closure Procedures.
Open file rept. (Final) 27 Sep 78-30 Jun 80,
George Akens, John Metz, and Paul Bilzi. Jun 80, 281p BUMINES-OFR-153-81
Contract J0285030

The purpose of this report is to provide industry with a document to aid in the selection of a closure method and to aid government officials in evaluating closure methods that have been used in the past. The types of seals presently in use for numerous engineering environmental and economic parameters were evaluated. A survey of State and Federal regulations pertaining to mine closure is included. Numerous drawings are also included along with several case histories of mine closures.

Evaluation of the Seismic System for Locating Trapped Miners.
Rept. of investigations,
John Durkin, and Roy J. Greenfield. 1981, 62p BUMINES-RI-8567
Library of Congress catalog card no. 81-2170.

This report discusses the configuration and system deployment for the postdisaster surface seismic system for detecting and locating trapped miners. It analyzes the results of 15 field tests to define a signal model, background noise levels, and subarray performance. A waveform modeling procedure is described and compared with observed waveforms. The resulting similarity indicates that the major factors affecting the signal amplitude, waveform, and spectral character are understood. A model is presented which gives the signal amplitude as a function of source type, source depth, and horizontal offset between source and receiver. Using this model a curve is presented which gives the range at which a signal will be detected for different signal and noise levels. Finally, and most important relative to the mission of the system, the ability of the system to detect signals on one or more subarrays is put into a probabilistic framework. For a strong source it is almost certain that a subarray directly over the source will detect the signal. After signal processing, it is highly likely that signals will be detected on sufficient subarrays to locate the trapped miner. Location errors have been found to be less than 100 ft in the majority of cases. Techniques have been used that can reduce the location errors to this level even when soil layer variation between subarrays is severe.

Coal Transportation: An Analysis of Cost and Energy Requirements (Sicherheitsaspekte einer Kuenftigen Europaeischen Wasserstoff-Technologie).
Final rept.
c1980, 279p EUR-6854-DE
Text in German.
Customers in the European Community countries should apply to the Office for Official Publications of the European Communities, B.P. 1003, Luxembourg.

A method of energy analysis is presented and applied to two different coal transport systems: slurry pipelines and unit trains. It covers different transport length assumptions as well as a wide range of bulk handling capacities, all in relation to realistic projects already considered in feasibility studies. Two different types of environment have been examined, the American and European, and a sensitivity analysis has been conducted on those parameters which may play an important role from the energy point of view. The necessity is underlined to conduct an energy analysis to integrate technical-economic factors, as well as the importance of assessing the results of both of these analyses.

Feasibility of the Connection of Wells in Hot Dry Rocks by Means of Hydraulic Fracturing Techniques: Experimental Research Dealing with Three-Dimensional Crack Interaction, Largely Utilizing Photoelastic Techniques.
Final rept.,
G. F. Camponuovo, and R. Riccioni. c1981, 129p EUR-7062-EN
Customers in the European Community countries should apply to the Office for Official Publications of the European Communities, B.P. 1003, Luxembourg.

Heat-exchange in hot dry rocks (HDR) has been analyzed by experimental and numerical tests of propagation and interaction of pressurized 3D cracks in an elastic medium. Two types of models in polyester and epoxy resin were made and penny-shaped cracks created in pre-established positions. Three configurations were investigated -- a single crack, simulating a penny-shaped crack generated at the bottom of a well by hydraulic fracturing; two co-planar cracks, simulating fractures from two wells with good alignment in the direction of the highest in situ stress; and two parallel cracks in planes, simulating poor alignment of the two-wells with respect to the direction of the highest in situ stress.

Underground Metal and Nonmetal Mine Fire Protection, Proceedings: Bureau of Mines Technology Transfer Seminars, Denver, Colorado, November 3, 1981, and St. Louis, MO., November 6, 1981.
Information circular.
Nov 81, 156p IC-8865

These proceedings consist of an overview of the underground metal and nonmetal mine fire protection research currently being conducted by the Bureau of Mines. The following papers address the areas of prompt, reliable fire detection, fire planning and warning, fire suppression, and personnel protection. Selected topics are included here that cover fire protection systems for shafts, underground fueling areas, and mobile underground mining equipment; spontaneous combustion, improved stench, and product-of-combustion fire warning systems; computer-aided ventilation modeling; fire doors; and an investigation of fire hazards in mine timbers. The projects described provide a current documentation of problems being addressed.

Rept. for Jan 66-Dec 81.
Dec 81, 115p

Topics in this bibliography include flotation separation processes of sulfide particles by causing selected particles to float by using different surface chemical properties. Nickel, copper, zinc, and iron sulfide are among the metallic sulfur compounds examined with reference to particle separation by froth flotation, foam separation, and foam flotation processes. Testing procedures and performance evaluations of the flotation process variations of the sulfides are included. The thermodynamics involved in the wetting behavior and flotation of sulfide minerals are discussed. (Contains 172 citations fully indexed and including a title list.)

Prepared in cooperation with the Department of Energy, Washington, DC.

Reports are cited which discuss flotation separation of mineral particles using the different surface chemical properties to cause the selected particles to float. Coal-washery flotation circuits are emphasized. Sorting and separating using compressed air jets into the mineral concentration, flotation reagent effects on coal concentrate quality, and economy of flotation separation of coal concentrates are included in this bibliography. Froth flotation, foam separation, and foam flotation processes are included with respect to oil and

water mixtures, ore concentrates, and minerals, as well as coal concentrates. (Contains 213 citations fully indexed and including a title list.)

Regional Tectonics and Seismicity of Eastern Nebraska.
Annual rept. Jul 80-Jun 81,
R. R. Burchett. Nov 81, 110p
See also report for Jul 79-Jun 80, NUREG-CR-2132.

This annual report presents and interprets the information obtained by the Conservation Survey Division (Nebraska Geological Survey) during contract year July 1, 1980 to June 30, 1981, under contract NRC 04 76 315 with the USNRC. The information pertains to the geology, structure, tectonics, and seismicity of eastern Nebraska with emphasis on central Otoe County. Some of the information presented here result from a combination of studies begun in earlier years but the greater part results from studies begun during the contract

year. The scope of the studies is summarized as follows: rock outcrops in Otoe County were reexamined and reevaluated, and 22 test holes were drilled to determine the altitude of the upper surface of the Elmont Limestone of Pennsylvanian age; one new seismograph was installed in eastern Nebraska; gravity surveys in eastern Nebraska were extended; ground magnetic surveys in Otoe County were made and evaluated, and age dating of two Precambrian cores was accomplished. Discussion of the results of these studies constitute the remainder of this report.

Trusted Interval in the Fourier Spectra of Accelerograms Digitized Either Manually or by Semi-Automatic Means (Intervalo Confiable en el Espectro de Fourier Obtenido de Acelerogramas Digitizados Manualmente o Con Medios Semiautomaticos),
Arturo Arias, and Horacio Sandoval. 1981, 50p 434
Text in Spanish.

A theoretical study is made of the effects of random digitization errors on the Fourier amplitude spectra of accelerograms or seismograms digitized either manually or by semi-automatic means. It is found that these effects may be split into three components. Two of them are due to errors of measurement of the trace ordinates: the first one is digitization errors by themselves whose behavior may be considered as white noise, while the second is the uncertainty caused in the definition of the reference line, and has marked influence at the lower frequency end of the spectrum. The remaining component is associated with errors of measurements of time (abscisae) and is relevant in the higher frequency range. This analysis allows the definition of a central reliable frequency band for the Fourier amplitude spectra in terms of the length of the record and the standard digitization error. Some comparisons with experimental results are offered.

Cutting Ice with High Pressure Water Jets (Decoupage de la Glace par de Puissants Jets D'eau).
Mechanical engineering rept.,
D. B. Coveney. Jul 81, 43p DME-MD-57, NRC-19643
Summary in French.

The potential of high pressure water jets to cut slots in an ice sheet, primarily for possible use as an assist to ice breaking, has been under investigation. In the field, slots have been cut into and through fresh water ice, about 0.7 m thick with water jets applying up to about 260 kW of power to the ice. This report describes the ice cutting performance of small to moderate scale water jets. The majority of cuts produced a narrow, clean kerf, indicative of erosion in a ductile material, while other cuts produced a wide spalled trench, indicative of spalling in a brittle material. Still others produced a combination of the two modes of cutting, with a wide, shallow trench and a narrow, deep kerf below the trench. In many cases the ice was also crazed extensively by the water jet. The causes and the effects of these characteristics on ice cutting performance are discussed, along with the effects of jet traverse speed, nozzle diameter, nozzle pressure, nozzle standoff, ice characteristics and the overall scale of the system. An empirical relationship, derived by regression analysis, is presented correlating the jet penetration to the power in the jet, the jet traverse speed, the nozzle stand-off and the estimated ice temperature.

A Macroscopic View of Snow Deformation under a Vehicle.
Special rept.,
Paul W. Richmond, and George L. Blaisdell. Jul 81, 25p Rept no. CRREL-SR-81-17

For snow with an initial density of less than 0.45 Mg/cu m, load transfer through shallow snow is shown to be attenuated by an interfacial boundary force. Evidence is presented that shows the existence of a density distribution in the deformed area. Results of a laboratory plate-sinkage test on sintered snow support this analysis. Maximum value obtained for the interfacial boundary force range from 1335 to 2670 N when the average density of the deformed area is about 0.5 Mg/cu m.

MIZEX. A Program for Mesoscale Air-Ice-Ocean Interaction Experiments in Arctic Marginal Ice Zones. I. Research Strategy.
Special rept.,
Peter Wadhams, Seelye Martin, Ola M. Johannessen, William D. Hibler, III , and William J. Campbell. Jun 81, 25p Rept no. CRREL-SR-81-19

This document describes the research strategy for a series of mesoscale studies of Arctic marginal ice zones. The main goal of this program is to gain a better understanding of the processes occurring at the ice margin. These processes are relevant to climate, weather forecasting, petroleum exploration and production, marine transportation, naval operations, and commercial fisheries. In addition, MIZEX will aid in determining what modifications to existing ice-ocean-atmospheric models are needed for better prediction near the ice margin. These goals are consistent with recommendations made by international scientific bodies, most notably those of the Joint Scientific Committee (JSC) in its plan for the World Climate Research Programme (WMO-ICSU, 1981). In this document the JSC states that for improved modeling it is necessary: 'To study the physical processes affecting interactions between air, ice and sea at the sea-ice margin and to develop methods for their adequate representation in climate models.' More specific details on initial field programs will be addressed in planning meetings in the near future. In addition, it is anticipated that other aspects of the program, such as modeling, will be addressed in future workshops, with the results distributed in a similar format to this research strategy.

A Model Describing the Microwave Emission from a Multi-Layer Snowpack at 37 Ghz.
M. Abdelrazik, F. Ulaby, and H. Stiles. Feb 81, 136p
NASA-CR-166708, RSL-TR-410-2
Grant NSG-5335

A multilayer emission model is described and applied to emission measurements obtained at 37 GHz and H polarization using a microwave radiometer attached to a truck-mounted boom in Steamboat Springs, Colorado in 1977. Estimated absorption and scattering coefficients and their dependence on wetness were obtained using calculated values of the dielectric constant at 37 GHz along with the model. It was found that the scattering coefficient is comparable in value to the absorption coefficient for dry snow however, the absorption coefficient increases linearly with increasing snow wetness while the scattering coefficient decreases linearly with increasing wetness. The emission from each layer of the snowpack was also calculated using the estimated coefficients. It is shown that for dry snow, the ground underneath the snowpack contributes about 45% of all measured emission while the rest is due to emission from all the layers within the snowpack. When the wetness of the top 5 cm layer of snowpack increases to about 2% by volume, this top 5 cm snowlayer contributes more than 90% of all the measured emission.

Contracts NAS9-15800, PROJ. AGRISTARS
Sponsored by NASA, Usda, Dept. Of Commerce, Dept. Of the Interior, and Agency for International Development. Erts.

Soil moisture data acquired to support the development of algorithms for estimating surface soil moisture from remotely sensed backscattering of microwaves from ground surfaces are presented. Aspects of field uniformity and variability of gravimetric soil moisture measurements are discussed. Moisture distribution patterns are illustrated by frequency distributions and contour plots. Standard deviations and coefficients of variation relative to degree of wetness and agronomic features of the fields are examined. Influence of sampling depth on observed moisture content an variability are indicated. For the various sets of measurements, soil moisture values that appear as outliers are flagged. The distribution and legal descriptions of the test fields are included along with examinations of soil types, agronomic features, and sampling plan. Bulk density data for experimental fields are appended, should analyses involving volumetric moisture content be of interest to the users of data in this report.

Soil Moisture Inferences from Thermal Infrared Measurements of Vegetation Temperatures.
R. D. Jackson. Mar 81, 14p E81-10184, NASA-CR-160954
Contract PROJ. AGRISTARS
Sponsored by NASA, Usda, Dept. Of Commerce, Dept. Of Interior, and Agency for International Development. Erts.

Thermal infrared measurements of wheat (Triticum durum) canopy temperatures were used in a crop water stress index to infer root zone soil moisture. Results indicated that one time plant temperature measurement cannot produce precise estimates of root zone soil moisture due to complicating plant factors. Plant temperature measurements do yield useful qualitative information concerning soil moisture and plant condition.

Contracts NAS9-15800, PROJ. AGRISTARS
Sponsored by NASA, Usda, Dept. Of Commerce, Dept. Of the Interior, and Agency for International Development. Erts.

A soil water computer model that uses the IBM Continuous System Modeling Program III to solve the dynamic equations representing the soil, plant, and atmospheric physical or physiological processes considered is presented and discussed. Using values describing the soil-plant-atmosphere characteristics, the model predicts evaporation, transpiration, drainage, and soil water profile changes from an initial soil water profile and daily meteorological data. The model characteristics and simulations that were performed to determine the nature of the response to controlled variations in the input are described the results of the simulations are included and a change that makes the response of the model more closely represent the observed characteristics of evapotranspiration and profile changes for dry soil conditions is examined.

An Evaluation of the Spatial Resolution of Soil Moisture Information.
Final Report.
K. R. Hardy, S. H. Cohen, L. K. Rogers, H. H. K. Burke, and R. C. Leupold. Mar 81, 83p NASA-CR-166724, ERT-P-7505-F
Contract NAS5-25527

Rainfall-amount patterns in the central regions of the U.S. were assessed. The spatial scales of surface features and their corresponding microwave responses in the mid western U.S. were investigated. The usefulness for U.S. government agencies of soil moisture information at scales of 10 km and 1 km. was ascertained. From an investigation of 494 storms, it was found that the rainfall resulting from the passage of most types of storms produces patterns which can be resolved on a 10 km scale. The land features causing the greatest problem in the sensing of soil moisture over large agricultural areas with a radiometer are bodies of water. Over the mid-western portions of the U.S., water occupies less than 2% of the total area, the consequently, the water bodies will not have a significant impact on the mapping of soil moisture. Over most of the areas, measurements at a 10-km resolution would adequately define the distribution of soil moisture. Crop yield models and hydrological models would give improved results if soil moisture information at scales of 10 km was available.

The Resilient and Plastic Characteristics of Michigan Subgrade Soils and Their Soil Support Values.
Final rept.,
Gilbert Y. Baladi, and Tesfai Goitom. Aug 81, 361p FHWA/MI/RD-81-02
Sponsored in part by Michigan Dept. of Transportation, Lansing.

In this study, the plastic and elastic characteristics of Michigan cohesive subgrade soils are evaluated using repeated load triaxial tests on undisturbed samples. The results of the investigation led to the development of a normalized predictive model of the plastic strain. The model has demonstrated its ability to evaluate and predict the plastic behavior of several materials subjected to cyclic loadings. The input parameters of the model consist of the static strength and the corresponding total strain of the material in question. The model was tested and evaluated using five different materials ranging from gravel, sand, clay and clayey silt. The developed normalized predictive model neutralizes the effects of several sample and test variables. The model was found to be unique for each class of soil and independent of compaction, density, water content and stress-level. Further, the model was used to develop a new approach and understanding of the soil support value of the 'Aashto Interim Guide for the Design of Flexible Pavement'.

Atmospheric Benzene Depletion by Soil Microorganisms.
Journal article,
James C. McFarlane, Amy Cross, Clyde Frank, and Robert D. Rodgers. 1981, 9p EPA-600/J-81-402
Pub. in Environmental Monitoring and Assessment 1, p75-81 1981. Prepared in cooperation with Northrop Services, Inc., Las Vegas, NV., Iowa Univ., Iowa City, and Idaho National Engineering Lab., Idaho Falls.

Gaseous benzene was rapidly depleted in exposure chambers containing viable soils and plants. When separate components of the system were analyzed, no benzene was detected in soils, plants, or water. Soil microorganisms were shown to be responsible for metabolizing benzene, yielding CO2 as the main product. The rates were sufficiently rapid to suggest that this reaction forms a major pathway for the elimination of benzene from the environment.

Methyl Parathion Persistence in Soil Following Simulated Spillage.
Journal article,
L. C. Butler, D. C. Staiff, and J. E. Davis. 30 May 80, 10p EPA-600/J-81-337
Pub. in Archives of Environmental Contamination and Toxicology 10, p451-458 1981.

Simulated spillage of emulsifiable concentrate (E.C) and microencapsulated formulations of methyl parathion on soil were studied. Persistence of residues from both formulations spilled as concentrates and as simulated drum rinses were followed for up to 45 months. Spillage of encapsulated formulation resulted in the formulation of a solid cake-like deposit on the soil surface, which could be a particularly attractive hazard to small children. At 45 months, soil residues had decreased by 64% for emulsifiable concentrate spills, and 68% for the soil beneath the microencapsulated cake. Residue in the cake itself only decreased by 31%. Soil residue levels from simulated drums rinses were essentially innocuous by 45 months for the emusifiable concentrate and by one year for the microencapsulated material. The leaching of methyl parathion from the microencapsulated cake into soil and the relationship between available residue and wet weather were investigated.

HOMEP - An Algorithm for Analysing Homogeneous Stress/Strain Histories,
C. M. Szalwinski. 1981, 103p CUED/D-SOILS/TR-115-1981
Sponsored in part by Transport and Road Research Lab., Crowthorne (England). Also pub. as ISSN-0309-7439.

An algorithm for transforming strain history into stress history (and vice versa) is described. It is called HOMEP and pertains to a single, homogeneous material element. HOMEP is intended for analyses in soil mechanics where the constitutive relations are significantly nonlinear. Several relations including Modified Cam Clay (of Critical State Soil Mechanics) are available. Its results can be stored on auxiliary file for post-processing by plotting algorithms.

Static Penetrometer for Soft and Loose Soils (Penetrometro Estatico Para Suelos Blandos Y Sueltos),
Enrique Santoyo, and Alfredo Olivares. Mar 81, 36p 435
Text in Spanish.

The geometric and electronic characteristics of a conventional static penetrometer are presented. The load capacity of its sensitive cells is adequate for soft cohesive or loose granular soils. A common hydraulic drilling rig is proposed as a driving mechanism of this penetrometer in soft or loose soils. To facilitate interpretation of results obtained with this instrument, a resume of the most accepted methods to obtain shear strength parameters is included.

EMP/EMI Hardening of Electrical Conduit Systems.
Technical rept.,
Paul H. Nielsen. Sep 81, 77p Rept no. CERL-TR-M-292

Properly designed and installed conduit systems can provide an effective EMP/EMI hardening technique for fixed facility construction. This report presents the results of a CERL study to provide design criteria and to conduct hardness assessments for such shielded systems. Leakage mechanisms are identified, and techniques for determining signal levels coupled to conductors inside conduit systems are presented. EMP shielding properties of conduit hardware items are analyzed and some experimental EMP hardened conduit hardware items evaluated. Finally, a number of 'in situ' test techniques for identifying and locating EMP-related defects in an installed conduit system are assessed. (Author)

Worst-Case Prediction of Single-Particle-Induced Permanent Failures in Microelectronics.
Technical rept. Apr-Sep 80,
Timothy R. Oldham, and James M. McGarrity. Jul 81, 19p Rept no. HDL-TR-1966

In recent years upsets caused by single particles passing through Si integrated circuits have been a serious concern in the semiconductor industry. In this report we calculate the threshold voltage shift caused by a single charged particle passing through the SiO2 layer of a metal-oxide-semiconductor field-effect transistor. This calculation rests on a number of worst-case assumptions: (1) recombination is neglected, (2) charge trapping is taken to be 100-percent efficient, and (3) maximum energy loss per unit path length is assumed. Under these conditions we calculate that permanent failure caused by a single alpha particle is possible in submicrometer-dimension devices. (Author)

Investigation for Low-Cost Permanent Magnets.
Annual rept. 1 Jul 80-30 Jun 81,
J. J. Becker. Sep 81, 48p Rept no. SRD-81-076
Contract N00014-80-C-0566

The crystallization of initially amorphous rapidly quenched alloys may provide new materials with good permanent magnet properties at low cost. Preliminary investigations indicate that phosphorus and carbon are favorable alloying elements, and that sudden changes in properties may occur as the identities of the crystallizing phases change. the exploration of alloy systems has been greatly speeded up by the use of current-pulse annealing. It has been found that remanence ratios may be quite high even though the orientation of the crystals formed is probably random. The course of crystallization has been followed by resistance monitoring in conjunction with current-pulse annealing. X-ray diffraction indicates that the highest coercive forces are attained in only partially crystallized samples. Magnetic domain structures have been studied in crystallized ribbons and also in bulk samples of some of the phases observed in them, using both Kerr effect and magnetic colloid. These studies have given useful information about the nature and the magnitude of the magnetocrystalline anisotropy in the phases formed. Alloys containing rare earth elements appear very promising and are being actively pursued. (Author)

Application of a Rare-Earth Cobalt Magnet to Synchronous Motors.
H. Yamada. 1981, 11p NAL-TR-656, ISSN-0389-4010
In Japanese; English Summary.

An experimental hysteresis rotor structure was produced in which a ring made of radially oriented anisotropic magnet material, Alnico 5 which has a large magnetic hysteresis loop, and a yoke made of inner steel are utilized. The prototype hysteresis motor has a large ratio of output power to magnet volume and a large starting torque as compared with conventional hysteresis motors. The structure, torque analysis, torque characteristics and equivalent circuit of the synchronous condition of the prototype synchronous motors are discussed. A comparison of the hysteresis and the permanent-magnet-type synchronous motor is also given.

Low Temperature Growth and Electrical Characterization of Insulators for GaAs MISFETS.
Semiannual Status Report, 1 May - 31 Oct. 1981.
J. M. Borrego, and S. K. Ghandhi. 31 Oct 81, 11p
NASA-CR-164972
Contract NAG3-175

Progress in the low temperature growth of oxides and layers on GaAs and the detailed electrical characterization of these oxides is reported. A plasma anodization system was designed, assembled, and put into operation. A measurement system was assembled for determining capacitance and conductance as a function of gate voltage for frequencies in the range from 1 Hz to 1 MHz. Initial measurements were carried out in Si-SiO2 capacitors in order to test the system and in GaAs MIS capacitors lubricated using liquid anodization.

Toroidal Magnet System.
Patent,
C. C. Baker, and T. Ohkawa. Filed 27 Dec 77, patented 21 Apr 81, 6p PAT-APPL-864 696
Supersedes PAT-APPL-864 696-77.
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 $0.50.

In a plasma device having a toroidal plasma containment vessel, a toroidal field-generating coil system includes fixed linking coils each formed of first and second sections with the first section passing through a central opening through the containment vessel and the second section completing the linking coil to link the containment vessel. A plurality of removable unlinked coils are each formed of first and second c-shaped sections joined to each other at their open ends with their bights spaced apart. The second c-shaped section of each movable coil is removably mounted adjacent the second section of a linking coil, with the containment vessel disposed between the open ends of the first and second c-shaped sections. Electric current is passed through the linking and removable coils in opposite sense in the respective adjacent second sections to produce a net toroidal field. (ERA citation 06:038842)

The Automatic Generation of Syntax Directed Editors.
Technical rept.,
Bruce J. MacLennan. Oct 81, 48p Rept no. NPS52-81-014

A syntax directed editor is an editor oriented towards a particular language. This paper describes a general table-driven syntax directed editor and an algorithm for automatically generating a syntax directed editor for a language from a description of that language. Aside from the convenience of a syntax directed editor, it is also a very efficient parser. No syntactic error recovery is required since the editor does not permit the user to make syntactic errors. Some of the implications of syntax directed editors for data structure manipulation and two dimensional languages are briefly discussed. (Author)

Exposure. A Newsletter for Ocean Technologists, Volume 9, Number 4,
Technical rept.,
Roderick Mesecar. Sep 81, 9p
Contract N00014-79-C-0004

This issue of Exposure is composed of the complete text of the Serial ASCII Instrumentation Loop (SAIL) data communications standard as drafted by technical members of the marine research community. Research vessels operating in the federal and university research communities are not outfitted with a common digital methodology to access or exchange operational data. to a large extent, science leadership is based on the widespread availability of instrumentation. In an earlier era, marine scientists could make fundamental discoveries with the equivalent of sealing wax and string. Today, an occasional worthwhile observation is made with simple tools, but the more significant advances now depend on the application of complex instrumentation. In most instances, new instrumentation techniques make possible a tenfold or greater speed in data collections, and in other instances make possible the measurements for experiments before inaccessible. Although this standard has other instrumentation applications, it is presented as one candidate specifically for intravessel digital data communications from sensors that monitor vessel parameters (position, speed, heading, etc.). The marine research community is very diffuse geographically and in research interests, which has partially contributed to the slow development of standard design criteria. However, standardization contributes to efficiency and technology dissemination because standards form the root words of a language for technical information transfer. (Author)

Cluster Analysis Algorithms for Image Segmentation.
Technical rept.,
M. F. Janowitz. Jul 81, 20p Rept no. TR-J8102
Contract N00014-79-C-0629

The goal of this research is the investigation of the ability of certain cluster techniques to segment monochromatic data collected by remote sensing devices. The particular example that will be considered consists of temperature data collected by the Air Force Geophysical Laboratory at Hanscom Air Force Base. The work was done on three levels: underlying motivations, simulations, and real data analysis. In this particular paper, we shall restrict our consideration to a single feature, with multiple feature selection to be investigated at a later date. Section 2 presents the motivation for both the cluster techniques and the statistics that they use, while section 3 briefly explains the techniques. In section 4, some simulated data is analyzed, and in section 5, the techniques are applied to actual infrared temperature data. The paper concludes with an indication of possible future directions for the current research effort.

Over the past several years the structured programming technology has gained wide use and acceptance throughout the Department of Defense. The concept of structured programming is to define a program with a single entry point and a single exit point, and to code in such a manner as to develop lower level functions as pieces which plug into higher level functions. By significantly reducing the number of interfaces, potential error points are eliminated. Structured programs tend to be less error prone, easier to read, easier to maintain; these characteristics obviously are attractive to cost-conscious projects with software contents. The structured programming discipline requires tools to support the implementation. Those tools germane to this report include: precompilers which accept structured source code and translate the structure figures into unstructured code acceptable to the respective compiler; and programming support libraries which maintain code at the unit (single page of code) level.

A Statistical Methodology for Constructing Synthetic Test Workloads.
Doctoral thesis,
Wayne Thomas Graybeal. May 79, 178p Rept no. AFIT-CI-79-305D-S

Computer performance measurement and evaluation (CPME) studies are conducted for the purpose of sizing and selecting a new system (selection studies); during the design phase of either a new system or a hardware/software modification to an existing system to assess the impact of the new system/modification (performance projection studies); or to assess and improve the level of performance of an existing system (performance monitoring studies). Nearly all performance measures used are related to the workload being processed by the system. There is the need for a workload which emulates the actual workload, yet executes

in less time and does not compromise the adequacy of the measurements. Such a workload is called a drive or test workload. A statistical methodology is proposed to aid in the construction of a test workload.

AD-A107 299/0 Mag Tape $900.00
Air Force Data Systems Design Center, Gunter AFS, AL.
Selective Inquiry System/Timesharing Retrieval Subsystem.
Software,
Paul J. Bart. 8 Nov 80, mag tape DOD/DF-81/017
Source tape is in Honeywell BCD character set. Character set restricts preparation to 9 track one-half inch tape only. Identify recording mode by specifying density only. Call NTIS Computer Products if you have questions. Price includes documentation, AD-A107 300. Sales restricted to federal, state and local government. No copies furnished by DTIC.

The Selective Inquiry System (SIS) is a generalized retrieval system designed for the reporting of data from single or multiple files in a batch environment. Input files may be sequential or indexed sequential. Data can be sorted on up to 20 keys prior to producing the report. A subsystem, TRS, is available for use through the facilities of the timesharing executive of the operating system. Software Description: The system is written in the GMAP programming language for implementation on a Honeywell 6000 computer using the WWMCCS GCOS 6.4 operating system. The computer memory requirement is 16k.

Deductive Synthesis of the Unification Algorithm,
Zohar Manna, and Richard Waldinger. Jun 81, 52p Rept no. STAN-CS-81-855
Contract N00014-76-C-0687, Grant AFOSR-81-0014
Prepared in cooperation with SRI International, Menlo Park, CA. Artificial Intelligence Center, Contract N00014-75-C-0816 and Weizmann Inst. of Science, Rehovoth (Israel). Sponsored in part by Grants NSF-MCS78-02591 and NSF-MCS79-09495.

the deductive approach is a formal program-construction method in which the derivation of a program from a given specification is regarded as a theorem-proving task. To construct a program whose output satisfies the conditions of the specification, we prove a theorem stating the existence of such an output. The proof is restricted to be sufficiently constructive so that a program computing the desired output can be extracted directly from the proof. The program we obtain is applicative and may consist of several mutually recursive procedures. The proof constitutes a demonstration of the correctness of this program. To exhibit the full power of the deductive approach, we apply it to a nontrivial example -- the synthesis of a unification algorithm. Unification is the process of finding a common instance of two expressions. Algorithms to perform unification have been central to many theorem-proving systems and some programming-language processors. The task of deriving a unification algorithm automatically is beyond the power of existing program-synthesis systems. In this paper, we use the deductive approach to derive an algorithm from a simple, high-level specification of the unification task. We will identify some of the capabilities required of a theorem-proving system to perform this derivation automatically. (Author)

A Distributed Algorithm for Minimum Weight Directed Spanning Trees.
Technical rept.,
Pierre A. Humblet. Sep 81, 22p Rept no. LIDS-P-1149
Contract N00014-75-C-1183, ARPA Order-3045
Sponsored in Part by Grant NSF-ECS79-19880.

A distributed algorithm is presented to construct minimum weight directed spanning trees (arborescences), each with a distinct root node, in a strongly connected directed graph. A processor exists at each node. Given the weights and origins of the edges incoming to its node, a processor follows the algorithm and exchanges messages with its neighbors until all arborescences are constructed. The amount of information exchanged and the time to completion are O(Absolute value of N squared).

The Connection Machine (Computer Architecture for the New Wave).
Memorandum rept.,
W. Daniel Hillis. Sep 81, 30p Rept no. AI-M-646
Contract N00014-80-C-0505

This paper describes the connection memory, a machine for concurrently manipulating knowledge stored in semantic networks. We need the connection memory because conventional serial computers cannot move through such networks fast enough. The connection memory sidesteps the problem by providing processing power proportional to the size of the network. Each node and link in the network has its own simple processor. These connect to form a uniform locally-connected network of perhaps a million processor/memory cells. (Author)

Image Segmentation with Color and Texture,
J. F. Boulter. Apr 81, 37p Rept no. DREV-R-4198/81

We examined how objects or regions in an image formed by the reflection of radiation from a scene can be segmented using differences in their color and texture. The color features (normalized red content and normalized blue content) permit good spatial resolution of the segmented regions, whereas the textural features (isotropic and linear textures) help to distinguish similarly colored objects. The color and texture features were chosen because of their low dependence on viewing conditions, such as surface orientation and illumination. As an example, we segment an olive-drab colored military truck from its background of vegetation.

Design and Utilization of an Infrared Data Base for an Advanced Image Interpretation Facility.
Final rept.,
Robert T. Root, Thomas E. Ray, Albert E. Brahosky, and Marshall A. Narva. Aug 80, 82p ARI-RN-80-25
Contract DA-49-092-ARO-158

A reference information data base for use in an advanced image interpretation facility was designed. The data base utilized three types of organization. Two types of organization utilized primarily representative infrared imagery examples. One type presented views of several targets under one set of acquisition parameters, while the second type presented views of one target type under all of the acquisition conditions. The third type of organization utilized primarily textual information. An indexing scheme and retrieval methodology were devised. The experimental data base, with associated software, was utilized to subject developed concepts to empirical test. One test was designed to ascertain if structured exposure to the data base would increase interpreter proficiency while another test was designed to study the efficiency of such a data base as an aid during interpretation. It was found that the request formats used on the CRT computer interface could be efficiently utilized with little training. The information presented on the slides in the data base could be easily utilized for training and as reference keys. Structured exposure to the data base in training sessions served to increase the participants' proficiency in identification, at the category level. However, no difference were found in performance between the two organizations of the imagery in the data base.

The Impact of Multiprocessor Technology on High-Level Language Design.
Final rept. May 78-Sep 79,
Arthur Evans, Jr., C. Robert Morgan, Eric S. Roberts, and Edmund M. Clarke. 10 Sep 79, 147p Rept no. BBN-4188
Contract DCA100-78-C-0028

As the cost of processor hardware declines, multiprocessor architecture become increasingly cost-effective and represent an important and attractive area for future research. In order to exploit the full potential of multiprocessors, however, it is necessary to understand how to design software which can make effective use of the available parallelism. This report examines the software environments of several existing multiprocessor systems and assesses the impact of multiprocessor architecture on the design of high-level languages and related software methodology. In particular, this report concentrates on an evaluation of the programming language Ada as a potential high-order language for real-time multiprocessor systems. We conclude that Ada does not, as currently designed, meet the needs for real-time embedded systems.

Performance Evaluation of Linear Algebra Software in Parallel Architectures.
T. L. Jordan. Oct 79, 30p
Contract W-7405-ENG-36

Performance data of parallel computers on several of the problems of linear algebra using direct methods are provided. The computers considered include software pipeline, hardware pipeline, single-instruction multiple-data, and multiple-instruction multiple-data. Special features of each architecture are considered. Factors such as start-up time, scalar-vector break-even points, consistency in operation count, parallel steps required, and speed-up and efficiency of the hardware are discussed. A reasonably broad comparison is given for LU factorization without pivoting. A less extensive comparison is given for LU factorization with pivoting. Also various intracomputer comparisons are presented to show the performance of different implementations of a particcular algorithm as well as the performance of different algorithms for solving the same problem. Data were collected for the linear algebraic problems of matrix multiplication, regular sparse systems (including tridiagonal systems and dissection techniques), and random sparse systems. The eigenvalue problem is not addressed. 15 figures, 7 tables. (ERA citation 05:007983)

NRCC Software Catalog. Volume 1.
Feb 80, 108p
Contract W-7405-ENG-48

The software library is organized into the principal scientific program areas of graphics, chemical kinetics, macromolecular science, numerical methods, physical organic chemistry, quantum chemistry, statistical mechanics, and crystallography. The text part of each catalog entry consists of a brief summary of the purpose, method and other attributes of the program. Further information is provided in the full program write-up. Literature references are given in some instances. The names of the authors, and in some cases place of origin of the program are given. Most of the programs coming from outside have undergone some modification for use on the CDC7600 and therefore the NRCC takes partial responsibility for maintaining them. Difficulties encountered in using programs should be brought to the attention of NRCC staff, not the original authors. A list of available files follows the program origin. The machine designators CDC, IBM, VAX have been added to distinguish the several machine specific source versions that exist for various programs. Note that all files are in either source (card image) or printed output (line image) format. The NRCC does not distribute object or CDC Update files. The support level and distribution status are indicated for each program using the classification code described earlier. (ERA citation 05:031448)

SAR Processing on the MPP.
Final Report, 9 Jan. - 31 Aug. 1981.
K. E. Batcher, E. E. Eddey, R. O. Faiss, and P. A. Gilmore. Aug 81, 88p NASA-CR-166726, GER-17020
Contract NAS5-26430

The processing of synthetic aperture radar (SAR) signals using the massively parallel processor (MPP) is discussed. The fast Fourier transform convolution procedures employed in the algorithms are described. The MPP architecture comprises an array unit (ARU) which processes arrays of data; an array control unit which controls the operation of the ARU and performs scalar arithmetic; a program and data management unit which controls the flow of data; and a unique staging memory (SM) which buffers and permutes data. The ARU contains a 128 by 128 array of bit-serial processing elements (PE). Two-by-four surarrays of PE's are packaged in a custom VLSI HCMOS chip. The staging memory is a large multidimensional-access memory which buffers and permutes data flowing with the system. Efficient SAR processing is achieved via ARU communication paths and SM data manipulation. Real time processing capability can be realized via a multiple ARU, multiple SM configuration.

National Aeronautics and Space Administration, Hampton, VA. Langley Research Center.
Comparisons of Some Large Scientific Computers.
K. R. Credeur. Oct 81, 38p NASA-TM-81928

In 1975, the National Aeronautics and Space Administration (NASA) began studies to assess the technical and economic feasibility of developing a computer having sustained computational speed of one billion floating point operations per second and a working memory of at least 240 million words. Such a powerful computer woild allow computational aerodynamics to play a major role in aeronautical design and advanced fluid dynamics research. Based on favorable results from these studies, NASA proceeded with developmental plans. The computer was named the Numerical Aerodynamic Simulator (NAS). To help insure that the estimated cost, schedule, and technical scope were realistic, a brief study was made of past large scientific computers. Large discrepancies between inception and operation in scope, cost, or schedule were studied so that they could be minimized with NASA's proposed new compter. The main computers studied were the ILLIAC IV, STAR 100, Parallel Element Processor Ensemble (PEPE), and Shuttle Mission Simulator (SMS) computer. Comparison data on memory and speed were also obtained on the IBM 650, 704, 7090, 360-50, 360-67, 360-91, and 370-195; the CDC 6400, 6600, 7600, CYBER 203, and CYBER 205; CRAY 1; and the Advanced Scientific Computer (ASC). A few lessons learned conclude the report.

Source tape is in ASCII character set. Character set restricts preparation to 9 track, one-half inch tape only. Identify recording mode by specifying density only. Call NTIS Computer Products if you have questions. Price includes documentation, PB82-121781.

Cats is a Cobol-to-Cobol analyzer/translator originally developed for use on the B3500/4700 computers at the project sites. Specifically designed grammar tables for the Cobol compilers in use at the time (RCA 3301, RCA 70/45, IBM 360 series, B3500/4700 and Honeywell 1800) were included in the Cats software to provide a capability to analyze and translate Cobol programs targeted for conversion. The structure of Cats allows for the following functions: (1) Analyze and Upgrade. Analyze Cobol source code to determine conformance with American National Standards Institute Cobol. During the analysis, Cats explores possible logic paths which may be taken at run time and uses this information to delete unreachable (dead) code via a REMOVE DEAD option and to identify potential translation problems caused by different implementations of the PERFORM statement. The upgrade function automatically modifies the source program to convert non-Ansi statements to Ansi statements where equivalency exists. (2) Translate. This function automatically translates upgraded Ansi statements written for the source computer to Ansi statements for the target computer. (3) Single Source Maintenance. This function, in conjunction with the translate function, permits development and maintenance of source programs on a single computer in an environment where several makes/models of hardware are in use. For example, programs may be developed and maintained on the B3500/4700 for execution on any of several other target computers. (Source code produced by this means must be recompiled on the target computer before use.) Primary use of Cats is to precondition programs prior to conversion...Software Description: The system is written in the COBOL programming language for implementation on a Burroughs 3500 computer using the MCP operating system. The computer memory requirement is 80K bytes.

Loren Overbo. 1 Aug 77, mag tape FSWEC-80/0048
Source tape is in EBCDIC character set. Tapes can be prepared in most standard 7 or 9 track recording modes for one-half inch tape. Identify recording mode desired by specifying character set, track, density, and parity. Call NTIS Computer Products if you have questions.

This program makes one, two, or three copies (or none at all) of an input sequential data set, depending on how many Ddnames are present in the JCL. File attributes (Blksize, Lrecl, and Recfm) are copied from the input file to the output file unless specified through JCL or existing file labels. Output file and input record count messages are provided on Sysmsg. The program will process blocked or unblocked files, containing fixed, variable, or undefined records...Software Description: The program is written in the ALC programming language for implementation on an IBM 360/65 computer using the OS MVT 21.8 operating system. Computer memory requirement is 10K.

PB82-121872 Mag Tape $95.00
Transportation Systems Center, Cambridge, MA.
Plotting Routines NOMEN and CLINE.
Software,
Robert Peabody. 10 Jul 81, mag tape FSWEC-79/0105
Source tape is in EBCDIC character set and certain fields contain packed decimal data. Character set restricts preparation to 9 track, one-half inch tape only. Identify recording mode by specifying density only. Call NTIS Computer Products if you have questions.

Cline is a Fortran callable subroutine which is used to draw different types of lines connecting points ((X sub i), (Y sub i)). Five different line options are available via the calling sequence. The user must supply his own calling program. Nomen is a Fortran callable subroutine which is used to draw an inch of line type followed by a title for annotation of a plot. One of five line types can be chosen along with any explanation of what the line type represents. The user must supply his own calling program...Software Description: The subroutines are written in the Fortran IV programming language for implementation on a DEC-10 computer using the TOPS-10 operating system. The computer memory requirement is 211.

COBOL Structured Code Analyzer.
Software,
Dale Brenneman. 1 Jun 80, mag tape FSWEC-80/0118
Source tape is in ASCII character set. Character set restricts preparation to 9 track, one-half inch tape only. Identify recording mode by specifying density only. Call NTIS Computer Products if you have questions.

Monitoring the use of structured programming by manual inspection of the Cobol source code is a time-consuming process. The Structured Code Analyzer will automatically detect and pinpoint occurrences of unstructured Cobol code by a static analysis of the source code. The input is a Cobol source program which was compiled with no errors. The output is a report containing two sections. The first is a listing of the Cobol source code which was analyzed, with a comment denoting the type of unstructured code printed to the right of the corresponding source code line where the type was found. The second section is a summary page, giving the total number of occurrences of each type of unstructured code found...Software Description: The program is written in the COBOL and ASM programming languages for implementation on a UNIVAC 1108/1180 computer using the EXEC, levels 33R3 and 36R2, operating system. The computer memory requirement is 16K words.

COBOL Audit and Debugging Aid (CADA INSERT). Technical Note.
Jul 76, 60p MSDO-M-011-TN-08A, FSWEC-81/0040-1
For system on magnetic tape, see PB82-121930.

The COBOL Audit and Debugging Aid (CADA INSERT) provides a means of evaluating test data for system development, conversion and program maintenance. It inserts coding to COBOL programs and identifies the logic paths within a program which have and have not been executed by the test data. Statistical information is provided in the form of two reports, the Detailed CADA Report and the CADA Summary Report. The information is useful in determining if further program testing is necessary according to accepted standards.

Project RMAG: SLANG (Structured Language) Compiler,
Robert A. Magnuson. Jan 80, 152p NIH-DCRT-DMB-SSS-UG105, NIH/DF-79/006B
Supersedes PB80-117559. For system on magnetic tape, see PB-294 144.

Sporting its new name, this is the long-promised 'RMAGASM in RMAGASM'. Designed to assist programmers writing powerful structured programs, the SLANG Compiler generates block-structured IBM 370 assembly language source code. Based on some six years experience developing and using the RMAG-implemented RMAGASM compiler, SLANG retains the important features of its predecessor while adding some original, new ones of its own. For example, SLANG's extension to the IF block permits the choice of n segments, while retaining--as a subset--the familiar two-segment choice. The new embellished SYSPRINT and STRUCTUR output datasets are potent tools used for the development and documentation of programs. SLANG has its own macro facility--available during its operation--enabling the user to easily create long or complex sequences of SLANG commands and structures. Useful macros can be created, tested, and saved independently. These macros can be made available to SLANG by the MACLIB command which references external libraries by Ddname. Macro definitions can also be included directly within SLANG source programs.

Harris Corporation, Harris 1600-02 Model II, Harris Interactive COBOL, Version 107.1 (Validation).
Validation summary rept.
21 Aug 81, 57p FCTC-81-104

This Validation Summary Report (VSR) for the Harris Interactive COBOL Compiler Version 107.1 (ECOS Version 106.1) provides a consolidated summary of the results obtained from the validation of the subject compiler against the 1974 COBOL Standard (X3.23-

1974/FIPS PUB 21-1). The compiler was validated at the Low-Intermediate level of FIPS PUB 21-1. The VSR is made up of several sections showing the discrepancies found. These include an overview of the validation which lists all categories of discrepancies by level/module within X3.23-1974, a section relating the categories of discrepancies to each of the Federal levels of the language; and a detailed listing of discrepancies together with the tests which were failed.

Standardization in Microcomputer/LSI Products Via Electronic Information Exchange: JEDEC/EIES Project.
Final rept. 1 Sep 78-30 Jun 80,
Peter Johnson-Lenz, and Trudy Johnson-Lenz. 30 Jun 80, 145p
Grant NSF-DSI78-09189

From September, 1978 through April, 1980, members of JEDEC (Joint Electron Device Engineering Council) committees and task groups experimented with using electronic information exchange in their standards development work. Under the aegis of the Electronic Industries Association (EIA), JEDEC is an association of firms concerned with the manufacture of solid state electronic components. Based on participant perceptions before and after the project and statistics about use of EIES (the Electronic Information Exchange System used as a test facility), the project had a generally positive outcome. EIES use affected JEDEC work by speeding the process, contributing to better decisions with more information available and more discussion, and by creating better continuity between meetings and a sense that participants went to meetings better prepared. Many other factors affecting use and impacts on JEDEC work were also investigated. Although electronic information exchange cannot be used as the primary communications medium for committees developing standards because of legal concerns and the cost of terminals, it does seem very useful for committee work between meetings and for specific task group work.

Codes for Named Populated Places, Primary County Divisions, and Other Locational Entities of the United States (Fourth Update); FIPS PUB-55.
Data file,
Henry Tom. 1 Dec 81, mag tape NBS/DF-81/006
Supersedes PB81-171266.
Source tape is in ASCII or EBCDIC character set. Character set restricts preparation to 9 track, one-half inch tape only. Identify recording mode by specifying density only. Call NTIS Computer Products if you have questions.

The files of the fourth update provide a unique code for each listed populated place, primary county division, and other locational entity. The tape now includes outlying areas. Additional data added to this update concern incorporated places, census designated places, Indian reservations, and Alaskan native villages. For incorporated and census designated places, the Master Reference File (MRF) numbers assigned by the U. S. Bureau of the Census have been added. Identification numbers assigned by the same agency have been added for Indian reservations and Alaskan native villages. Identification numbers of all Congressional Districts (CD's) in which these places, reservations, and villages are located have been added also. If any of these entities are located in a Standard Metropolitan Statistical Area (SMSA), that information is recorded. Four indexing fields are used on the tape, but are not printed in the hard copy version.

Design Concepts for a Hierarchical Two Dimensional Multiprocessor Structure,
D. Aldabass. Mar 79, 35p CONTROL SYSTEMS CENTRE-439

Consideration is given to the partitioning of the Instruction and Data streams of a conventional von Neuman program. A 2D array of processors is formulated which operates under a different parallel processing mode in each dimension. Two types of 2D concurrency are identified: one at the instruction level, and the other at the program level. Concepts for a 2D hierarchy are developed and imposed on the structure to aid control. Some aspects of hardware design are discussed.

SYCOL: A High Level Language for Applications in Real Time Control Systems,
S. J. Young. Feb 79, 28p CONTROL SYSTEMS CENTRE-449

The rapid advance of microprocessor technology is creating many new application areas for real time computer control techniques. Advanced methods such as multivariable and adaptive control are now becoming economically feasible using low cost microprocessor hardware. However, development in this area is being severely hindered by the lack of good software tools and in particular by the lack of suitable high level languages. This report outlines the main features of a new high level programming language specifically designed for the real time control applications area. The language called SYCOL (Systems and Control Oriented Language) is based upon the experimental language MODULA but includes additional facilities to meet the specific needs of computer control systems.

The Use of Applicative Programming in Data Processing.
Progress rept.,
C. Kalus. Jul 79, 19p RSL/ENG-673/2
Portions of this document are not fully legible.

The purpose of this project is to investigate the use of applicative programming languages in Data Processing. One advantage of applicative languages is that their semantics tend to be simple, this in turn can simplify the task of verifying programs written in such languages. The author wishes to investigate whether it is currently practicable to applicatively program data processing problems and to completely verify these programs. If this is feasible, it will result in a much higher level of confidence in the programs than is otherwise possible.

Evaluation Criteria for a CODASYL Query Language.
Interim rept.,
Frank Manola, John Smith, and Diane Smith. 10 Mar 80, 150p CCA-80-17, NBS-GCR-81-337
Contract NB79-SBCA-0088
See also PB82-136755.
Also available in set of 3 reports PC E16, PB82-136730.

This report describes evaluation criteria which will be used in the development by CCA of a query Language for CODASYL-type data structures. The evaluation criteria will be the basis for a specific set of capabilities to be provided by the query language. The capabilities to be provided are determined by choosing, for each evaluation criterion, a position describing a specific level of capability. The evaluation criteria are also useful in the evaluation of existing query languages. In addition to a discussion of the evaluation criteria and positions, the report includes a description of those database users for which a query language based on the proposed evaluation criteria is intended. The report also discusses related language facilities which might appear in the context of such a query language.

Capabilities for a CODASYL Query Language.
Interim rept.,
Frank Manola. 10 Jun 80, 126p CCA-80-18, NBS-GCR-81-338
Contract NB79-SBCA-0088
See also PB82-136748, and PB82-136763.
Also available in set of 3 reports PC E16, PB82-136730.

This report describes proposed capabilities which are to be provided in a query language being designed by CCA which will operate on CODASYL-type database structures. In order to define the nature of these capabilities in a way sufficiently detailed to be the basis of language design, the capabilities are illustrated by examples using two prototype languages. These languages, while not complete, are currently under investigation. The languages are SNEQUEL, based on IBM's relational query language SQL, and CODAPLEX, based on Shipman's functional language DAPLEX. Proposed capabilities include those necessary for querying relational, as well as CODASYL, databases.

Estimation of Sensor Detection Probabilities with Data from Concurrent Sensors.
Technical rept.,
Donald R. Barr. Aug 81, 29p Rept no. NPS55-81-014

When several sensors are concurrently scanning the same domain for signals, varying numbers of sensors may detect each signal. On some occasions, a signal may not be detected by any of the receivers. Using detection data collected from all the receivers over a period of scanning, it is possible to estimate the total number of signals that occurred in that period (including those that were not detected at all), as well as the detection probabilities for the individual receivers. Several estimators for these quantities are developed, in the contexts of several models concerning the signal generation process and the receiver behavior. (Author)

Differential PCM Systems,
Ethirajan Janardhanan, and B. Kinariwala. Mar 78, 49p EE-77-CANO3, NSF/RA-780915
Grant NSF-ENG74-19788

Matched predictor differential PCM systems are analyzed for stationary first order Gauss Markov process inputs. The computational procedure yields convergent solutions for the variance and the probability density function of the point-wise error for all sampling intervals. Time average error between the input signal X(t) and a time continuous estimate are computed, and it is used as the basis for finding the optimum number of quantizer levels and hence the optimum sampling interval, for a given bit rate. For time average error values of practical interest, 4 level DPCM is superior; the time average error exceeds the appropriate rate-distortion bound by only 2.5 db. A comparison with a good PCM system shows that 4 level DPCM is superior for large bit rates and the difference increases with bit rate. The same DPCM systems are analyzed under the assumption that the prediction error is Gaussian and the results are within 10% of the exactly computed results for the region of optimum performance.

Cross Correlation in a Space-Diversity System on a Military Vehicle.
Final technical rept, Jul 80-Oct 81,
Gerhard Flachenecker, and Lothar Tschimpke. Aug 81, 105p
Contract DAJA37-80-C-0347

Mobile reception in built-up areas is disturbed by interference-fading effects due to multiple incident waves caused from reflecting and scattering objects in the vicinity. The fading can be reduced with the help of space-diversity systems, i.e. with more than one antenna on the car. The fade-reduction factor or the diversity gain of such a system strongly depends on the cross correlation of the antenna-output voltages. The related correlation factor is a function of frequency, is influenced by the car's surface, and depends on the mounting locations of the antennas. If a space-diversity system shall be established, proper antenna locations on the car in mind have to be determined. This report records the results of determining the cross correlation between antennas for various antenna-mounting configurations for a US Army 1/4-ton truck, M151 A2. The antenna receiving patterns are measured for the various configurations. These signal strength measurements are converted to correlation factors of signal power by assuming a Rayleigh distribution of the multipath signal strengths. The Rayleigh distribution has been shown to accurately characterize multipath reception in the 30-80 MHz band in built-up areas. In this manner, the requirement for time-consuming test drives was eliminated, and a more thorough investigation of the cross correlation phenomena was made possible for the same resources. (Author)

Contract DAAB07-77-C-0569

For about the past decade the development of microwave acoustic delay lines has seen few innovations. It is primarily for this reason that opportunities in the production of these lines leading to lower cost and improved performance was not realized. Such innovations include monolithic matching, mosaic transducers and an intensive investigation of processing steps and systems operation. All aspects of delay line design have been reexamined including media loss and anisotropy, transduction efficiency, diffraction and transducer film analysis. The net result of this effort is an essentially new approach to delay line design. This design lends itself well to batch fabrication processes with resulting cost reductions and performance improvement. (Author)

Contract DAAB07-78-C-2992

This final report details the technical progress achieved on task II of the program Surface Acoustic Wave Microwave Oscillator and Frequency Synthesizer. The objective of the Task II effort ws to establish a synthesizer design which, when packaged, provided a significant reduction in size, weight and power consumption as compared with current direct synthesis techniques. The hardware implementation was to

highlight Surface Acoustic Wave (SAW) device applications specifically geared toward addressing performance parameters such as switching speed, frequency step size, and total achievable bandwidth, as well as maximum suppression of spurious modes. The approach chosen was to incorporate SAW devices as oscillators and delay lines/filters, together with monolithic large scale itnegrated circuits which work at RF frequencies (RF-LSI) is an iterative mix-and-divide architecture. To this end, a brassboard synthesizer has been fabricated and delivered. At program completion, the brassboard unit is fully operational and has been tested in order to characterize typical unit performance capabilities. The delivered synthesizer demonstrated outstanding switching speed, settling in less than 25 ns and provided an output whose phase noise was measured to be within the specified requirements, as measured to within 2 MHz of the carrier at an output frequency of 1308 MHz. Output spectral flatness was obtainable to within + or - 1.2 dB over the operational band, with achievable output power greater than +10 dBm. (Author)

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A flashlamp drive circuit is described in detail. The device uses an unsaturated transistor as a current mode switch to periodially subject a partially ionized gaseous laser excitation flash-lamp to a stable, rectangular pulse of current from an incomplete discharge of an energy storage capacitor. A monostable multivibrator sets the pulse interval, initiating the pulse in response to a flash command by providing a reference voltage to a non-inverting terminal of a base drive amplifiers. A tap on an emitter resistor provides a feedback signal sensitive to the current amplitude to an inventory terminal of the amplifier, thereby controlling the pulse amplitude. The circuit drives the flashlamp to provide a square-wave current flashlamp discharge.

Focal Axis Resolver for Offset Reflector Antennas.
Patent Application,
R. F. Schmidt. Filed 2 Oct 81, 20p N82-10287/2, NASA-CASE-GSC-12630-1
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A method and apparatus for determining the focal axis of an asymmetrical antenna (such as an offset paraboloid reflector) are described. A transmitting feed horn array is located at the known focal point of an offset reflector antenna and aligned with an estimated focal axis of the antenna. The array is coupled to an amplitude or phase comparison feed circuit which is adapted to provide sum and difference output fields. The feed horn array is rotated in discrete steps in at least one plane about an axis through the focal point of the antenna. At each step the far field radiation is received and detected in amplitude and the minimum value of the difference pattern at each step is noted. An indication of the true focal axis is provided by the extreme values of difference signal or the relative phase difference.

Transportation Contingency Plans for Future Gas Shortages will not Meet Commuter Needs.
1 Jul 81, 53p Rept no. GAO/CED-81-79
Report to the Congress.

The disruption caused by gasoline shortages of the 1970s and the resulting problems commuters experienced pointed out the need to prepare for future shortages. The Department of Transportation has encouraged the development of transportation contingency plans at the local level to maintain commuter mobility during petroleum shortages. Few urban areas, however, have prepared plans which would be very helpful. Further, progress in developing contingency plans has slowed down in many areas. New efforts are needed to spur areas to complete contingency plans and improve plans already developed so that all areas will be better prepared to respond to commuters' transportation needs, should they arise. Questions Concerning DOE's Assignment of Operating and Testing Responsibilities for OTEC-1.
30 Jun 81, 12p Rept no. GAO/EMD-81-92

OTEC is one of the potential energy sources being developed to provide alternatives for reducing the Nation's dependence on imported oil. When developed, OTEC is to use the temperature variants of the ocean to produce electricity and energy intensive products. OTEC-1 is a major part of DOE's developmental program for OTEC. It is a floating test facility designed primarily for conducting sea tests of the cleanability

and performance of heat exchangers, a major component of OTEC systems. Related OTEC subsystems are also being tested. OTEC-1 was to be accomplished in three phases; design (phase I); construction (phase II); and operations and testing (phase III). In July 1977, DOE contracted with TRW, Inc. to design and develop the heat exchanger to be used on OTEC-1. In September 1978, DOE contracted with Global Marine to refurbish, retrofit, and deploy an old Navy ship with OTEC subsystems including TRW's heat exchanger. Together Global Marine and TRW were the OTEC-1 design and construction contractors for phases I and II with Global Marine having overall responsibility for integrating its and TRW's work. Global Marine's contract also included an option for performing work in phase III. (Author)

The Oil Shale Corporation Loan Guarantee Contract.
10 Sep 81, 14p Rept no. GAO/EMD-81-142

The loan guarantee contract with The Oil Shale Corporation (Oil Shale) is generally consistent with the requirements of The Defense Production Act of 1950, as amended, (DPA). However, it is questionable whether three aspects of DPA were fully adhered to. The first relates to the requirement that financial assistance be for synthetic fuels to meet national defense needs. Although on June 27, 1981, the Secretary of Defense certified that the Department of Defense (DOD) needs the project's synthetic fuel product for the national defense, we noted that the contract suggests otherwise. The contract calls for DOD to purchase from Oil Shale fuels at market prices which are not necessarily derived from the syncrude, unless DOD exercises an option to purchase the syncrude directly. The second aspect regards whether immediate actions were taken to achieve synthetic fuels production for national defense needs. While immediate actions were taken after enactment of the DPA amendments to set a process in place for implementing the program authorized, it is questionable whether the process was as timely as possible. Due to time constraints, we were unable to analyze the potential advantages and disadvantages of alternative approaches which might have reduced the overall time frame for making awards. The policy statement regarding geographic dispersion of facilities was not met because the two awards under DPA are in the same geographic area. However, the Department of Energy (DOE) stated the facilities are the first to be able to start construction in the next year and a practical problem exists.

Energy Impacted Area Development Assistance Program's Designation Criteria.
26 Jun 81, 10p Rept no. GAO/EMD-81-103

The Energy Impacted Area Development Assistance Program was established by section 601 of the Powerplant and Industrial Fuel Use Act of 1978 (P.L. 95-620, November 9, 1978). The objective of the program is to help areas impacted by coal or uranium production, processing, or transportation. The program is funded through DOE and administered by the Farmers Home Administration of the Department of Agriculture. It provides grants for both the development of growth management and housing plans and the development and acquisition of sites for housing and public facilities. For fiscal years 1979 and 1980, $61 million was allocated to a total of 23 States. Ten percent of that amount, about $6 million, was for planning grants and the remainder, about $55 million, was for site acquisition and development. The types of projects currently being financed under the program include site acquisition for a housing project for the elderly, site development for a water storage facility, water and sewer lines for a housing project, and site acquisition and development for a health complex. Minerals Critical to Developing Future Energy Technologies, Their Availability, and Projected Demand.
25 Jun 81, 36p Rept no. GAO/EMD-81-104

The next 20 to 30 years are expected to be a period of transition from major dependence on conventional energy sources such as oil and natural gas to an era more dependent on nonconventional renewable and virtually inexhaustible sources of energy. The viability of these future alternative energy sources is contingent, in part, on future materials and minerals availability, technology, and cost. On June 20, 1980, you asked GAO to identify minerals critical to developing future energy technologies, their availability, and projected demand. In your letter, you stated that strategic and critical minerals constraints on the United States capability to meet expected requirements of future major alternative energy technologies represent a critical consideration in formulating a national energy policy and, as such, are of immediate interest to the Committee. From GAO's effort, you stated that the Committee should be able to 'identify whether legislation is needed to develop new alloys or substitutes; increase domestic, foreign, and undersea supplies; develop new technologies; promote recycling; augment stockpiles, etc.' (Author)

Burdensome and Unnecessary Reporting Requirements of the Public Utility Regulatory Policies Act Need to be Changed.
Report to the Congress.
14 Sep 81, 34p Rept no. GAO/EMD-81-105

This report addresses the need to continue two sections--116 and 133--of the Public Utility Regulatory Policies Act of 1978. Title I of the act was established to encourage conservation of energy supplied by electric utilities, efficiency in use of facilities and resources by these utilities, and equitable rates to electricity consumers. Section 116 requires annual reporting by State regulatory authorities, nonregulated electric utilities, and the Department of Energy, on their status in complying with parts of the act relating to consideration of retail electric regulatory and ratemaking standards. Section 133 of the act requires certain utilities to biennially submit extensive cost-of-service filings to the Federal Energy Regulatory Commission and their respective State regulatory authorities. GAO, recommends that the Congress repeal the annual reporting requirement effective after the third annual report, and that the Federal Energy Regulatory Commission review and revise its cost-of-service reporting regulations to reduce the burden on utilities. If this review finds the reporting costs to be greater than the reporting benefits, the Commission should ask the Congress to repeal the cost-of-service reporting requirement.

Elimination of Federal Funds for the Heber Project will Impede Full Development and Use of Hydrothermal Resources.
25 Jun 81, 25p Rept no. GAO/EMD-81-110
Report to the Chairman, Subcommittee on Energy Development and Applications, Committee on Science and Technology House of Representatives.

High-temperature hydrothermal resources have a significant potential for generating electricity which can help reduce the Nation's dependence on fossil fuels. The majority of these resources, however, can only be efficiently used with binary cycle geothermal technology. The Department of Energy was sharing the cost of the Heber binary cycle geothermal demonstration project to show the viability of binary cycle geothermal powerplants and stimulate the use of this technology. However, the administration has proposed to eliminate Federal funding of this project. The administration believes that private industry should solely undertake this demonstration project. The elimination of Federal funding for this project could cause it to be terminated. Private industry currently cannot undertake this project, because of its high technical risks and economic uncertainties, without the assistance of the Government.

Options for Establishing an Energy Conservation Consolidated Grant Program.
8 Jul 81, 14p Rept no. GAO/EMD-81-115

The choice of design features for block grants is properly a political function that should be driven by the ultimate objectives the Congress is seeking to achieve. Block grants intended to continue Federal stewardship of national objectives in a more flexible or decentralized manner should have significantly different design features than block grants intended principally to devolve Federal responsibilities back to State and local governments. In designing a block grant program, the Congress must consider the trade-offs between State and local discretion and Federal control. At one end of the spectrum, block grants may become indistinguishable from general revenue sharing, if, for example, a maintenance of effort provision is not included. On the other hand, detailed Federal eligibility rules, standards, or funding requirements could transform the block grant into a categorical grant, thus lessening any benefits that could be realized from greater State and local discretion. A balance should be sought between the extent of flexibility provided to State and local governments and the degree of accountability to the Federal Government required to assure that the program's national objectives will be met. A number of different provisions can be incorporated into block grants to facilitate the achievement of national objectives. The provisions considered should be nonintrusively framed to encourage States and localities to meet national objectives in the broadest possible way and provide flexibility. The provisions could encourage achievement of goals without specifying the means to be used. (Author)

The United States Remains Unprepared for Oil Import Disruptions. Volume I. Summary: Includes Conclusions and Recommendations.
Report to the Congress.
29 Sep 81, 87p Rept no. GAO/EMD-81-117-VOL-1
See also Volume 2, AD-A106 922.

The U.S. Government is almost totally unprepared to deal with disruptions in oil imports. Oil import disruptions--such as the 1973 oil embargo and the 1979 Iranian shortfall--pose a significant threat to national security, and the lack of effective contingency planning and program development to data is serious and requires immediate attention. The Government must make a determined commitment to emergency preparedness now, while oil markets are slack, to prepare for any future disruption.

Federal Energy Regulatory Commission Needs to Act on the Construction-Work-in-Progress Issue.
23 Sep 81, 12p Rept no. GAO/EMD-81-123

The financial indicators of the electric utility industry have deteriorated due to high inflation, high interest rates, accelerating construction costs, decline in demand, and a less than adequate rate of return. This has led to uncertainty about the industry's ability to attract investment capital. GAO sees the real issues as

being whether companies need rate relief to maintain financial integrity, and whether construction programs which depend on such relief are needed to meet future electric energy demands.

Department of Energy, Washington, DC.
Symposium on Commercial Aviation Energy Conservation Strategies, April 2-3, 1981. Papers and Presentations.
Apr 81, 354p
Prepared in cooperation with Federal Aviation Administration, Washington, DC.

The Symposium provided a forum in which representatives from DOE, FAA, National Aeronautics and Space Administration (NASA) and the aviation industry exchanged information and ideas regarding current and future efforts to conserve fuel and to promote energy conservation within the commercial aviation sector. General topics discussed included Federal and industry energy conservation programs such as flight operations, air traffic control, engineering and maintenance, and corporate management strategies. The Symposium, was highlighted by a panel discussion entitled 'Energy Conservation: Where Do We Go From Here.' This report contains the papers and presentations from the Symposium.

Solar Total Energy: Large Scale Experimental at Shenandoah, Georgia. Phase III. Preliminary Design. Final Report, October 1, 1977-July 31, 1978.
Sep 78, 567p
Contract AC04-77ET20260
Portions of document are illegible.

The basic function of the STES at Shenandoah is to supply the electric power, process steam, and space heating and cooling demands of the expanded 3900 square meters (42,000 ft exp 2) Bleyle Plant and for the STES Mechanical Building. The Bleyle factory, initially equipped with its own independent (conventional) energy source, will derive at least 60% of its annual energy needs from the sun when the solar energy system becomes operational in the first quarter of 1981. The design and systems analysis of the STES are detailed. The Solar Collection Substation consists of an array of 192 seven meter diameter, parabolic dish collectors which provide a temperature rise to a flow of Syltherm 800 fluid through each collector in a parallel closed, hydraulic circuit. The receiver is a cavity type with the incident concentrated solar flux impinging upon an absorptive surface enclosed within an insulated cylindrical shell. The trickle oil/dual media concept was selected for the high temperature storage system. The Power Conversion Subsystem consists of a three piece pool-type boiler with preheater, boiler, and superheater, a GFE steam turbine-generator set rated at 400kWe supplied by Mechanical Technology, Inc., a condenser and condensate storage tank, make-up demineralizer, deaerating heater, and boiler feed pump. In normal operation, steam at 655 exp 0 K (720 exp 0 F) and 4.8 x 10 exp 6 N/m exp 2 (700 psig) is generated in the boiler-super-heater, heated by Syltherm 800, and delivered to the turbine inlet. The Thermal Utilization Subsystem major components include a 2.1 x 10 exp 10 Joule (20 MBtu) capacity, sensible heat water, low temperature storage (LTS) subsystem, a 1.25 x 10 exp 6 Joules/second (354 ton) absorption chiller derated to provide 6.09 x 10 exp 5 Joules/second (173 tons) with inlet hot water at 372 exp 0 K (210 exp 0 F), and two separate cooling towers for heat rejection from both the absorption chiller and the PCS condenser. Integration of Solar Energy into Utility-System Planning and Strategies: 1980-2000.
Jul 80, 288p CONF-8005180-
Conference on the integration of solar energy into utility system planning and strategies: 1980-2000, Topeka, KS, USA, 11 May 1980.

The purpose of the conference was to address the following questions that the utility industry must face as they make short and long-range plans to meet the nation's energy needs: (1) How do utilities develop plans for solar energy in demand forecasting, plant expansion, capital requirements, load management, and consumer relations. (2) Which solar technologies will emerge as dominant in the future. (3) What rate of growth in the utilization of solar energy can be expected by utility managers. (4) How can utilities use information on developments in solar technology in their operations, planning, and management. (5) What part can utilities expect to play in the financing and control of major solar energy technologies. The views and information presented at the conference are recorded in 17 speeches and presentations. (ERA citation 06:034501)

Expert Judgments for Policy Analysis.
M. G. Morgan, M. Henrion, and S. C. Morris. 1980, 138p BNL-51358
Contract AC02-76CH00016

This report summarizes the deliberations of a small invitational three-day workshop, which explored the current state of the art and identified research needs in eliciting and using subjective probabilistic expert judgments for policy analysis involving energy and environmental systems. Part 1 of this report discusses the growing importance of these techniques and outlines the structure and objectives of the workshop. Part 2 summarizes many of the workshop's most-important deliberations. Part 3 contains a preliminary description of some of the essential elements of a program of national research which should be mounted in this area in order to provide the theoretical and applied understanding necessary to support a widespread adoption of techniques that use subjective expert judgments, stated in probabilistic terms, by regulatory agencies that are concerned with energy and environmental systems. Vertical Axis Wind Turbine Control Strategy.
G. M. McNerney. Aug 81, 21p SAND-81-1156
Contract AC04-76DP00789

Early expensive in automatic operation of the Sandia 17-m vertical axis research wind turbine (VAWT) has demonstrated the need for a systematic study of control algorithms. To this end, a computer model has been developed that uses actual wind time series and turbine performance data to calculate the power produced by the Sandia 17-m VAWT operating in automatic control. The model has been used to investigate the influence of starting algorithms on annual energy production. The results indicate that, depending on turbine and local wind characteristics, a bad choice of a control algorithm can significantly reduce overall energy production. The model can be used to select control algorithms and threshold parameters that maximize long-term energy production. An attempt has been made to generalize these results from local site and turbine characteristics to obtain general guidelines for control algorithm design. (ERA citation 06:034671)

Technology Assessment of Solar Energy Systems: Potential Soil Erosion Effects of Harvesting Crop Residues for Energy Production.
M. F. Torpy, L. J. Habegger, M. A. Snider, and T. G. Surles. Jan 81, 38p ANL/EES-TM-152
Contract W-31-109-ENG-38

An evaluation is presented of the potential increase in erosion that could result from removal of the ground cover that the residues provide. The study indicates that removal of crop residues sufficient to produce 0.13 and 0.42 x 10 exp 15 Btu of end-use energy (as specified, respectively, in the two scenarios addressed by the Technology Assessment of Solar Energy Program) would have little effect on soil erosion except in a few areas. An alternative scenario is addressed in which all reasonably available crop residues would be harvested to produce 1.5 x 10 exp 15 Btu of end-use energy. The approach used in evaluating erosion due to removal of residue is also described. (ERA citation 06:034503)

Strategic Analysis of Conservation and Solar Energy Policies.
R. J. Goettle, IV, P. J. Groncki, and E. A. Hudson.
Jun 80, 27p BNL-51373
Contract AC02-76CH00016

A wide range of specific policy measures concerned with increasing the technical efficiencies of energy use and promoting the use and competitiveness of various solar, renewable resource, and conservation technologies are examined. The focus is on the socioeconomic impacts of two policy packages - the Basic and the Enhanced. The packages are examined for their economic, distributional, energy, and environmental effects. The introduction of the Basic package of conservation and solar programs is estimated to have favorable impacts on all major socioeconomic criteria - energy imports and energy use, real incomes and productivity, inflation, distribution, and environment. Intensifying the policy measures beyond those in the Basic package, or at least intensifying them in the direction defined by the Enhanced package, creates additional energy and economic benefits but the economic improvements cannot match the costs imposed by the new policies. Preliminary Definition and Characterization of a Solar Industrial Process Heat Technology and Manufacturing Plant for the Year 2000.
T. Prythero, and R. T. Meyer. Nov 79, 34p
Contract W-7405-ENG-36

A solar industrial process heat technology and an associated solar systems manufacturing plant for the year 2000 has been projected, defined, and qualitatively characterized. The technology has been defined for process heat applications requiring temperatures of 300 exp 0 C or lower, with emphasis on the 150 exp 0 to 300 exp 0 C range. The selected solar collector technology is a parabolic trough collector of the line-focusing class. The design, structure, and material components are based upon existing and anticipated future technological developments in the solar industry. The solar system to be manufactured and assembled within a dedicated manufacturing plant is projected to consist of the collector and the major collector components, including reflector, absorber, parabolic trough structure, support stand, tracking drive mechanism, sun-sensing device and control system, couplings, etc. Major manufacturing processes to be introduced into the year 2000 plant operations are glass-making, silvering, electroplating and plastic-forming. These operations will generate significant environmental residuals not encountered in present-day solar manufacturing plants. Important residuals include chemical vapors, acids, toxic elements (e.g. arsenic), metallic and chemical sludges, fumes from plastics, etc. The location, design, and operations of these sophisticated solar manufacturing plants will have to provide for the management of the environmental residuals.In addition, national level evaluations of the economic and environmental impacts of expanded solar technologies will have to account for these new operations for new solar manufacturing plants that may be located at enlarged or new industrial sites across the nation. Bidding and Production Profiles for the Various Outer Continental Shelf Leasing Methodologies, 1954 to 1978.
L. A. Bruckner, and G. J. Thomas. Aug 80, 44p
Contract W-7405-ENG-36

The 1978 Outer Continental Shelf Lands Act Amendments charged the government with promulgating new regulations concerning the leasing of offshore tracts for hydrocarbon development. Among the reasons for this charge were to increase competition, reduce front-end money, and stimulate production. We used box plots to provide profiles of the bidding and production data from the different historical leasing methodologies. These profiles can be used to provide insights into the present data and to allow comparison with results of the new regulations. (ERA citation 05:033267)

US Energy Sources and Materials Needs.
D. A. Freiwald. Apr 80, 8p
Contract W-7405-ENG-36

It takes energy to build energy systems, and energy to obtain the nonrenewable fuels. This energy must be added to the energy used by consumers to obtain the total US energy demand. The minerals crisis is discussed in relation to the worldwide population minerals resource demand. As the world consumes its high-grade ores, lower-grade ores will be used at increasing expense. Part of the expense is due to the fact that it takes much more energy at increasing expense to process low-grade ores. It must also be recognized that high-grade energy sources are needed to obtain and fabricate the materials for soft-technology systems. Needed actions are noted. (ERA citation 05:022507)

15 Mar 80, 211p
Contract AT01-76ET10696

ASPEN is operational and a production version has been made available for industrial test participants. Changes for improvements or for fixes to problems are being made regularly in response to user inputs. Some catalogued procedures called executives in CMS language at MIT have been implemented for users to allow convenient execution of ASPEN and to print out results. A preliminary User's Manual of about 1000 pages has been prepared. Training materials have been developed for an introductory user course. Three courses have been held and 92 users have attended these. The four principal areas of work during this period were in documentation, instruction, coding and testing. The remaining model abstracts were completed. A description of the input language for the economic evaluation system was completed. This description will ultimately be incorporated in the User's Manual along with supporting documentation. Several demonstration problems, were prepared on cost estimation. A Data Regression System has been completed. (ERA citation 05:030101)

Irrigation Market for Solar Thermal Parabolic Dish Systems.
H. Habib-agahi, and S. C. Jones. 1 Sep 81, 40p
NASA-CR-164955, JPL-PUB-81-85
Contracts NAS7-100, DE-AT04-81AL-16228

The potential size of the onfarm-pumped irrigation market for solar thermal parabolic dish systems in seven high-insolation states is estimated. The study is restricted to the displacement of three specific fuels: gasoline, diesel and natural gas. The model was developed to estimate the optimal number of parabolic dish modules per farm based on the minimum cost mix of conventional and solar thermal energy required to meet irrigation needs. The study concludes that the potential market size for onfarm-pumped irrigation applications ranges from 101,000 modules when a 14 percent real discount rate is assumed to 220,000 modules when the real discount rate drops to 8 percent. Arizona, Kansas, Nebrasks, New Mexico and Texas account for 98 percent of the total demand for this application, with the natural gas replacement market accounting for the largest segment (71 percent) of the total market.

Secondary and Compound Concentrators for Parabolic Dish Solar Thermal Power Systems.
L. D. Jaffe, and P. T. Poon. 15 Apr 81, 47p NASA-CR-164960, JPL-PUB-81-27
Contract NAS7-100
Sponsored in Part by Doe.

A secondary optical element may be added to a parabolic dish solar concentrator to increase the geometric concentration ratio attainable at a given intercept factor. This secondary may be a Fresnel lens or a mirror, such as a compound elliptic concentrator or a hyperbolic trumpet. At a fixed intecept factor, higher overall geometric concentration may be obtainable with a long focal length primary and a suitable secondary matched to it. Use of a secondary to increase the geometric concentration ratio is more likely to e worthwhile if the receiver temperature is high and if errors in the primary are large. Folding the optical path with a secondary may reduce cost by locating the receiver and power conversion equipment closer to the ground and by eliminating the heavy structure needed to support this equipment at the primary focus. Promising folded-path configurations inclue the Ritchey-Chretien and perhaps some three element geometries. Folding the optical path may be most useful in systems that provide process heat.

Social Control of Energy: A Case for the Promise of Decentralized Solar Technologies.
R. W. Gilmer. May 80, 42p
Contract AC05-76OR00033

The case for simplified social control is developed in two ways. First, decentralized solar technology and centralized electric utilities are contrasted in the ways they assign property rights in capital and energy output; in the assignment of operational control; and in the means of monitoring, policing, and enforcing property rights. Second, an analogy is drawn between the decision of an energy consumer to use decentralized solar and the decision of a firm to vertically integrate, that is, to extend the boundary of the firm by making inputs or further processing output. Decentralized solar energy production offers the small energy consumer the chance to cut ties to outside suppliers - to vertically integrate energy production into the home or business. The development of this analogy provides insight into important noneconomic aspects of solar energy, and it points clearly to the lighter burdens of social management offered by decentralized solar technology. (ERA citation 05:026584)

Energy Use in Minnesota Public Buildings: Data Management and Analysis.
E. Hirst, and C. Eastes. Aug 80, 48p
Contract W-7405-ENG-26

Data collected by the Minnesota Energy Agency from 1860 public buildings are examined. Considerable attention is devoted to questions of data quality. Validation tests are developed and applied to the data from these buildings. Roughly speaking, 15% of the data elements examined were missing and another 15% were almost surely incorrect. These errors seriously distort both the descriptive statistics and the regression results obtained from further analysis of this data. Examination of the clean data shows that total energy use in the 1977/78 fiscal year ranged from a low of 210 thousand Btu/ft exp 2 (2.39 billion J/m exp 2) for the typical garage to a high of 345 thousand Btu/ft exp 2 (3.92 billion J/m exp 2) for the typical hospital. More than half the buildings report natural gas and more than one-fourth report fuel oil as the primary heating fuel. Only 13% of the buildings are heated with electricity. Regression equations are developed to explain variations in energy use among buildings for fossil fuel, electricity, and total energy use per unit floorspace. Independent variables include fuel prices, heating degree days, annual operating hours for lights, fraction of the building air conditioned, and dummy variables for primary heating fuel and for hospitals. These equations can be used to help decide which buildings should receive on-site energy audits. (ERA citation 05:032461)

Variflex Corp., Washington, DC.
Worldwide Transportation/Energy Demand, 1975-2000. Revised Variflex Model Projections.
R. U. Ayres, and L. W. Ayres. Mar 80, 176p
Contract W-7405-ENG-26

The salient features of the transportation-energy relationships that characterize the world of 1975 are reviewed, and worldwide (34 countries) long-range transportation demand by mode to the year 2000 is reviewed. A worldwide model is used to estimate future energy demand for transportation. Projections made by the forecasting model indicate that in the year 2000, every region will be more dependent on petroleum for the transportation sector than it was in 1975. This report is intended to highlight certain trends and to suggest areas for further investigation. Forecast methodology and model output are described in detail in the appendices. The report is one of a series addressing transportation energy consumption; it supplants and replaces an earlier version published in October 1978 (ORNL/Sub-78/13536/1). (ERA citation 05:020804)

State Flows of Energy in 1975.
P. L. Rice. Nov 79, 429p
Contract W-7405-ENG-26

This report highlights the distribution or flows of energy between states; it provides a supplement to Energy Availabilities for State and Local Development: 1975 Data Volume (ORNL/TM-6951). State flows are reported for the ten energy regions defined by the Department of Energy. Energy imports and exports are disaggregated into foreign and inter-regional components and the mode of transport indicated. The best analysis and presentation of energy flows is for natural gas. The report provides reference material on natural gas consumption, production, and distribution and has potential utility for: (1) determining the potential impact of curtailments; and (2) conducting cost-benefit analyses of the redistribution of natural gas between users and between states. Of equal significance is the integration and consolidation of data for crude oil and petroleum-product flows. Unpublished state-to-state flows by tanker and barge from PAD III (the largest petroleum-producing region) were combined with information on inter-regional pipeline shipments and foreign shipments to create a complete picture of the production, consumption, and distribution of all petroleum products, such as gasoline. There is additional information on flows of coal and electricity. The data for bituminous coal shipments between states is for utilities with 25 megawatts or greater capacity. The electricity data is based on the Form 412 reports filed by large utilities in 1974. (ERA citation 05:005869)

Research on Noneconomic Factors Relevant to the Diffusion of Solar Total Energy Systems.
L. G. Berry, and L. M. Bronfman. Aug 80, 78p
Contract W-7405-ENG-26

This report has two major purposes: (1) to review and evaluate the policy uses of some of the concepts and models found in diffusion-of-innovation literatures other than those of economics and marketing and (2) to apply the results of this review to the specific case of a Solar Total Energy System (STES). The research effort had three parts. The first part was to identify and obtain an overview of the noneconomics social science literatures relevant to the problem of forecasting and accelerating adoption rates. After the first part was completed and the principal research perspectives and researchers in the field had been identified, a workshop of experts was organized to address the problem of predicting and accelerating diffusion rates for STESs. Finally, the results of the literature review and the workshop were summarized, and a number of approaches suggested by the diffusion literature were used to obtain an evaluation of the adoption potential of STES. Major conclusions of the report are (1) diffusion models have a limited predictive value; (2) a number of general policy guidelines for programs aimed at increasing diffusion rates are provided by the literature; and (3) STES diffusion is likely to be rather slow unless substantial contextual changes or policy interventions take place. (ERA citation 05:031871)

Contract NAS7-100
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A module is described with a receiver having a solar energy acceptance opening and supported by a mounting ring along the optic axis of a parabolic mirror in coaxial alignment for receiving solar energy from the mirror, and a solar flux modulator plate for varying the quantity of solar energy flux received by the acceptance opening of the module. The modulator plate is characterized by an annular, plate-like body, the internal diameter of which is equal to or slightly greater than the diameter of the solar energy acceptance opening of the receiver. Slave cylinders are connected to the modulator plate for supporting the plate for axial displacement along the axis of the mirror thereby shading the opening with respect to solar energy flux reflected from the surface of the mirror to the solar energy acceptance opening.

Use of Fuel Oil by Stationary Sources in California.
Final rept.,
J. A. Trapasso, A. L. Shrope, and H. A. Rose. Mar 81, 169p PES-397, ARB-R-81/150
Contract ARB-A8-123-31

The report presents the methodology and results of a study to determine fuel oil usage by the agricultural, residential and industrial/commercial/institutional sectors in California during calendar year 1977. Fuel oil was defined to include both distillate and residual oils (Type Nos. 1, 2, 4, 5, and 6), but excluded crude oil burned as fuel. The use of fuel oil by power plants was not included in the study.

Preliminary Estimates of Wind Power Potential at the Nevada Test Site.
Technical memo.,
Howard G. Booth. Jul 81, 19p NOAA-TM-NWS-WR-166, NOAA-81100801

The assessment of the potential for useful conversion of wind power to electrical power is quite complex because of the many factors involved, both of a climatological and an engineering nature. The climatologist's capability is in attempting to describe the available wind power for the Nevada Test Site (NTS) and comparing it in a relative sense with what is known for other parts of the country. Climatological factors of concern are the average magnitude of the wind power density (watts/m) and its spatial and temporal variability.

BIGMAC: Basic Interactive Geothermal Model with Aquifer Characterization; A User's Guide,
Peter Kroll, William F. Barron, Kwang Yu, and William J. Toth. Oct 81, 64p JHU/APL/QM-81-089
Contract DOE-EX-76-A-36-1008
Also pub. as Johns Hopkins Univ., Baltimore, MD. Center for Metropolitan Planning and Research rept. no. MCGER-81/001.

A User's Guide to the Basic Interactive Geothermal Model with Aquifer Characterization (BIGMAC) is presented. This program is an enhancement of a previously published program, the Demand Specified Model (DSM), to allow representation of a geothermal aquifer's characteristics and their effects on pumping energy and drawdown. The report lists the modifications made to DSM in order to create BIGMAC, describes how to operate the program, shows samples of the program's output, and summarizes the commands available in BIGMAC.

Potential Fuel Conservation from Regulatory Reform of the Trucking Industry.
Final rept.
Jul 80, 106p CRA-446.01, DOT-P-50-81-92
Contract DOT-OS-90027

This study estimates the likely fuel savings from implementing 11 motor carrier regulatory reforms; some of which were enacted subsequently by the Motor Carrier Act of 1980. Fuel savings from implementing each reform separately as well as all together are given. Maximum feasible -- technically possible -- and most likely estimates are given.

Urban Transportation Energy Accounts. Volume I - Procedures. Volume II - Case Study of the Chicago Region.
Final rept. Jun 78-May 81,
D. E. Boyce, M. C. Romanos, B. N. Janson, P. Prastacos, and M. Ferris. Sep 81, 255p UMTA-IL-11-0027-81-1
Contract DOT-IL-11-0027

This manual describes procedures for compiling a set of urban transportation energy accounts. These procedures deal specifically with ground-mode person travel in an urbanized area but could be generalized to other modes, commodities and regions. There are several significant differences between these procedures and methods used by other studies to estimate the energy consumption of urban person trips. First, these procedures produce estimates of both direct and indirect energy consumption. Second, energy consumption is computed by mode for each origin-destination pair of zones. Third, automobile speeds and transit vehicle occupancies calculated for individual link flows are used to estimate energy consumption per person trip over each zone-to-zone trip path. Link flows are obtained from the use of trip assignment models in the UTPS or PLANPAC transportation planning computer software.

Strategies for State Participation in OCS Exploration Decisions: Onshore Facilities Related to Offshore Oil and Gas Development.
Mar 80, 224p NERBC/RALI-5
Portions of this document are not fully legible.

The report discusses the many consultation documents the states will receive in the course of the OCS Exploration decision-making process. It also outlines planning needs, strategies for promoting state policies, and institutional and organizational options for effective participation in decision making. This document aims to provide state and local officials with information related to outer continental shelf (OCS) oil and gas development in frontier regions.

Municipal Energy Initiatives in the Northeast,
John Alschuler. Sep 80, 33p HUD-0002065
Contract HUD-H-4435

This report suggests ways that local governments can save energy both within their own operations and throughout their communities and introduces the issue of municipal energy management and community energy efficiency. The potential energy management activities of local government are discussed, including internal operations, crisis intervention, community energy conservation, community planning, production, and energy planning and data analysis. Some examples of local government energy initiatives are described, and characteristics of successful energy initiatives developed by Seattle, Wash., Portland, Oreg., Davis, Calif., are outlined. These characteristicsc include plan preparation using trained staff and public participation; mandatory provisions; emphasis on alternative energy resources; and financial incentives. Barriers to effective action in the northeast are outlined, including lack of clearly defined local authority, lack of resources, scarcity of local public planning data, and the small number of publicly - owned utilities. Six Federal actions are recommended, including mandating State - enabling legislation, providing financial support to local government, mandating municipal involvement, providing financing for conservation and alternative production, requiring uniform data collection, and preserving the multifamily housing stock. Municipal energy experiences in Franklin County, Mass., Hartford, Conn., Paterson, N.J., and Portland, Maine, and a list of municipal assistance resource agencies are appended.

Marketing and Market Acceptance Data From the Residential Solar Demonstration Program: 1980. Volume 1: Detailed Analysis.
1980, 229p HUD-0002073
Contract HUD-H-2372

Solar homes were inspected and builders, buyers, and institutions involved in solar homes were interviewed to gather information about the marketability and acceptance of active residential solar energy. The study was conducted as part of the HUD Residential Solar Heating and Cooling Demonstration Program, which was designed to promote the development of a self - sustaining solar energy industry. Study participants include 138 builders, 276 buyers, and lending officers, municipal and county officials, utility representatives, and insurance agents involved with solar homes, as well as similar respondents involved with conventional homes. About 85 percent of the builders questioned expressed satisfaction with their experience in the demonstration program. Their sales experience has been largely successful and their costs recoverable. They also like the minimal red tape and construction problems encountered in solar home building and the promotional and publicity advantages of the solar home. Houses constructed in the demonstration program are similar in style and offer the same amenities and features as new conventional housing in the same areas. Solar homebuyers are concerned mainly with such traditional home values as product quality and effective market location. Purchasers closely resemble buyers of similarly priced conventional houses and do not consider the solar energy system as the only or most important factor in the purchase decision. Interviews with institutional representatives reveal few existing financial, administrative, or legislative impediments to residential solar application. Insurance companies currently do not differentiate between solar and conventional homes and are mainly concerned that the system be properly constructed and installed. Findings strongly indicate that residential solar energy is being accepted in the marketplace. Figures, tables, footnotes, and a map are included. (Author abstract modified).

Intermediate Minimum Property Standards for Solar Heating and Domestic Hot Water Systems. Volume 5.
1977, 296p HUD-0002085
Paper copy available from Supt. of Docs., Washington, DC 20402.

These standards on solar heating and domestic hot water systems have been prepared as a supplement to the Minimum Property Standards (MPS) and deal only with aspects of planning and design that are different from conventional housing because of the solar systems under consideration. The document contains standards and requirements applicable to one - family and two - family dwellings, multifamily housing, and nursing homes and intermediate care facilities. The text's references to the MPS refer to the same section in the 'Minimum Property Standards for One - and Two - Family Dwellings,' and related documents. Generally, the chapters and divisions are organized to parallel the chapters and divisions contained in the MPS. Within divisions, however, these standards list the solar topic sequentially; they do not follow the numbering of the MPS. Commentaries on certain standards are included to give further explanation and guidance to users with respect to solar installation. Technical data, definitions, abbreviations, referenced standards, and graphic illustrations of terms used in the standards are appended. (Author abstract modified).

Water, Watts, and Wilds Hydropower and Competing Uses in New England.
Final rept.
Aug 81, 186p
Original contains color plates: All DTIC and NTIS reproductions will be in black and white. Includes envelope with maps.

This report concludes a three year Hydropower Expansion Study conducted by the New England River Basins Commission. Basic objectives of the study were: to assess the feasibility of developing hydropower facilities at existing dams and undeveloped sites throughout the New England region; to clarify competing use issues which arise from the competition between hydropower development and other uses of water resources, and to assess the likelihood that conflicts would arise from such competition; and to provide information and data which will facilitate either the avoidance or resolution of competing use conflicts. The key findings from the study are summarized.

Accelerated Stress Testing of Solar Photovoltaic Modules.
Interim rept.,
S. E. Trenchard. Sep 81, 29p CGR/DC-25/81, USCG-D-59-81

In 1974, the U.S. Coast Guard began investigating solar photovoltaic arrays as power sources for marine aids to navigation. Initially, 53 systems consisting of a solar array, battery, and a flashing lamp load were placed in a rooftop test facility adjacent to Long Island Sound in Groton, CT. Within two years, the solar arrays of 25 systems had no power output thereby indicating failure. Effects of the marine environment were judged

to be responsible for the failures. In order to use solar arrays on operational aids to navigation, much greater reliability was essential. Consequently, development work was initiated on an accelerated stress test system that would rapidly identify solar photovoltaic modules capable of surviving in the marine environment. This interim report traces the history of accelerated stress testing of solar photovoltaic modules carried out at the U.S. Coast Guard R&D Center. It describes the military standard tests to which the prototype modules were exposed to and the results of that exposure. The report traces the evolution of the simultaneous multiple stress test to the present marine environment screening test. The results of exposure to the marine environment screening test of 136 test modules are reported. (Author)

Active Superconductive Generator Development 400-Horsepower Generator Design.
Research and development rept.,
Howard O. Stevens, and Michael J. Cannell. Oct 81, 119p Rept no. DTNSRDC/PAS-81/14

A superconductive acyclic generator has been designed and constructed using the unique current-carrying capabilities of superconducting wire in the field winding to produce a very high flux density in the rotor region. This, along with the use of liquid-metal current collectors in lieu of conventional brushes has yielded a very high power density machine designed to operate at gas turbine speeds. The nominal 300-kilowatt generator is 0.66 meter long and 0.46 meter in diameter (26 x 18 inches) and is designed to operate at 19,500 revolutions per minute. Extrapolation of the design analyses indicates no barriers to operation up to 750 kilowatts. Efficiencies of 98% are estimated over the practical operating range.

High-Temperature Fuel Cell Research and Development. Final Technical Status Report, June 1977-September 1978.
J. J. Rasmussen, R. Guidotti, and P. Lessing. 15 Oct 78, 218p DOE/ET/11320-T6
Contract AC02-77ET11320

An initial survey of the literature produced a list of ceramic materials (other than lithium aluminate) with properties which made them potential candidates for use in molten-carbonate fuel cell tiles or electrodes. Seven of the materials in the original list were dropped from consideration because of unfavorable thermodynamic properties; four materials were set aside because of high cost, lack of availability, or fabrication difficulties. Thirteen compositions were tested statically at 1000 K in a Li sub 2 CO sub 3 -K sub 2 CO sub 3 bath under a dry CO sub 2 atmosphere. Only four of the materials tested showed severe degradation reactions in the molten carbonate. A low-temperature process for forming small diameter, high-aspect ratio ceramic fibers for fuel cell use has been developed. A short-term program to initiate a computer study on the thermodynamic analysis of fuel cell materials was initiated at Montana State University. The MHD and high-temperature fuel cell literature was surveyed, and material properties were evaluated to identify MHD materials with potential use for fuel cell applications. A technology transfer report of these findings was prepared. Laboratory facilities were established to conduct research on interfacial diffusion processes which could be detrimental to successful long-term operation of the solid-electrolyte fuel cell. A variety of physical and chemical techniques were examined for the preparation of high-density substituted LaCrO sub 3 which was to be one component of a diffusion coupled with Y sub 2 O sub 3 -stabilized ZrO sub 2 . Hydrolysis of a mixed metal-nitrate solution with urea produced the most reactive powder. A final theoretical density of almost 98% was attained in cold-pressed sintered discs of this material. Investigation of Solar Cells Base on Cu sub 2 O. Final Progress Report, June 1, 1980-May 31, 1981.
L. C. Olsen. Jul 81, 50p SERI/TR-9190-1-T3
Contract AC02-77CH00178

Investigations of Cu sub 2 O solar cells concentrated on junction fabrication. In particular, studies were carried out with the objective of determining if it is possible to fabricate a Cu sub 2 O junction with a built-in voltage significantly greater than 1 eV. Low level efforts were devoted to Cu sub 2 O substrate fabrication and characterization, and n-type film studies for Cu sub 2 O hetero-junctions. A Cu sub 2 O cell structure based on a Ti/Cu sub 2 O Schottky barrier was selected for a detailed study. Dark I-V analyses were carried out for thick film Ti/Cu sub 2 O Schottky barriers as a function of temperature. Concentration profiles were obtained for Ti/Cu sub 2 O structures with Auger Spectroscopy. (ERA citation 06:034530)

Conceptual Design Study of Potential Early Commercial MHD Powerplant. Final Report of Task 2 Results.
F. A. Hals. Mar 81, 256p DOE/NASA/0051-2, NASA/CR-165235
Contract AI01-77ET10769

The first phase (Task I) of the program consisted of parametric analysis of three different reference power plants. This second phase (Task II) consisted of the conceptual design of one of the reference plants analyzed in Task I. This power plant was identified as attractive and selected for further study in Task II on the basic of Task I results. It employs oxygen enrichment of the combustion air and preheating of this oxygen enriched air to an intermediate temperature of 1200 exp 0 F attainable with a tubular type recuperative heat exchanger. The plant has a nominal plant capacity of 950 MW/sub e/. Conceptual designs of plant components and equipment with performance, operational characteristics and costs are reported. Plant economics and overall performance including full and part load operation are reviewed. Performance analysis showed that a net plant efficiency of 43.9% is attained at nominal load. The projected performance and estimated costs of this early MHD plant are shown to be attractive compared to conventional power plants, although it does not offer the same high efficiency and low cost as the mature MHD power plant considered in ECAS. Environmental aspects and the methods incorporated in plant design for emission control of sulfur and nitrogen are reviewed. Results from reliability/availability analysis conducted are also included. (ERA citation 06:033435)

Contract AC02-78ET25309

Life testing of palladium-loaded and low platinum-loaded anodes on type C supports and with type no. 01 current collectors was continued and terminated. Additional life-test data are reported for high Pt-loaded and a second low Pt-loaded anode. The 6 in. x 6 in. depth cell has been operated at reduced hydrogen back pressures, and the effect of the resulting flooding of the hydrogen chamber upon cell performance has been determined. Furthermore, two 6 in. x 6 in. depth cells were fabricated from the same type platinum support and current collector, but following different preparation procedures. Cell performance was compared at various submergence depths under identical operating conditions. In view of their attractive cost/performance characteristics, two groups of type C/sub alpha / platinum anodes were prepared and tested in zinc electrowinning cells. Finally, a 1 ft. x 1 ft. cell module was designed and constructed, along with a 3 ft. x 3 ft. electrolyte chamber in which the cell will be tested at various depths. (ERA citation 06:035088)

Possible Effects of Government and Industry Standards on Photovoltaic Products Liability.
M. Eisenstadt. Aug 81, 34p SAND-81-7034
Contract AC04-76DP00789

Products liability law is becoming more favorable toward the defendant, after two decades in the opposite direction. Industry and government standards and regulations can affect liability lawsuits involving producers and sellers of photovoltaic (PV) equipment. Design and fabrication in accordance with such standards are admissable as evidence, but does not determine legal issues. In some states, compliance is presumption that ordinary care was used and that the product is not defective or unreasonably dangerous. Good standards can aid in litigation in at least three ways: (1) they indicate that an industry is making a good-faith effort to police itself, creating a positive image of the defendant; (2) although they tend to be considered minimums for product safety and the courts are not obligated to accept them as adequate, they do provide guidance; this is particularly important for completely new products; and (3) perhaps most important, standards are one element in determining if a product complies with the state of the art, which in some states, can be used as a defense. (ERA citation 06:034502)

Design and Assembly Considerations for Redox Cells and Stacks.
D. K. Stalnaker, and A. Lieberman. Sep 81, 12p
DOE/NASA/12726-10
Contract AI04-80AL12726

Individual Redox flow cells are arranged electrically in series and hydraulically in parallel to form a single assembly called a stack. The hardware currently being tested in the laboratory has an active electrode area of either 310 cm exp 2 (0.33 ft exp 2) or 929 cm exp 2 (1 ft exp 2). Four 310 cm exp 2 (0.33 ft exp 2) stacks, each consisting of 39 active cells, have been incorporated into a 1.0 kW preprototype system. The physical design of the stack is very critical to the performance and efficiency of the Redox storage system. The mechanical aspects of the cell and stack design for the current Redox hardware, with regard to sealing the stack internally as well as externally, minimizing shunt currents and minimizing the electrical resistance of the stack are described. National Hydroelectric Power Resources Study. Preliminary Inventory of Hydropower Resources. Volume 1. Pacific Northwest Region.
Jul 79, 241p
Contract AI01-77RA11025

The preliminary inventory and analysis procedures provide a comprehensive assessment of the undeveloped hydroelectric power potential in the US and determines which sites merit more thorough investigation. Over 5400 existing structures have been identified as having the physical potential to add hydropower plants or increase hydropower output thereby increasing our present hydropower capacity from a total of 64,000 MW to 158,000 MW and our energy from 280,000 GWH to 503,000 GWH. While the physical potential for this increase is clearly available, some of these projects will undoubtedly not satisfy more-detailed economic analysis as well as the institutional and environmental criteria which will be imposed upon them. Summary tables include estimates of the potential capacity and energy at each site in the inventory. In some cases, individual projects may be site alternatives to others in the same general location, when only one can be considered for hydropower development. The number of sites per state is identified, but specific information is included for only the sites in Alaska, Idaho, Oregon, and Washington in this first volume. (ERA citation 05:033369)

Ocean Thermal Energy Conversion Preliminary Data Report for the February 1978 GOTEC-03 Cruise to the Gulf of Mexico, Mobile Site.
Jun 80, 34p
Contract W-7405-ENG-48

Preliminary physical, chemical, and biological data obtained on the GOTEC-03 cruise in February 27 to March 3, 1978 to the Mobile Site near 29 exp 0 N, 88 exp 0 W are presented in tabular and graphic form. The physical and chemical data consists of salinities and dissolved oxygens derived from water samples and temperatures from XBT's. The biological data includes biomass indicators (chlorophyll a, phaeophytin, and adenosine triphosphate), and zooplankton samples. The XBT and other physical data including current data collected on the GOTEC-03 cruise are reported elsewhere in Molinari, Hazelworth, and Ortman. (ERA citation 05:031874)

Support Services for Commercialization of Small Hydroelectric Facilities in North Carolina.
J. L. Warren. Jun 80, 203p RTI-1671/01-02F

Small hydro is defined as those hydroelectric resources available at existing sites with a potential capacity of less than 25,000 kW, or 25 MW. There is no limitation on the height of the dam. North Carolina has between 3000 and 4000 dams. Section II reviews the assessment of the small hydro resource available in North Carolina with different data sources. Section III details the assistance given to small hydro developers in North Carolina. Section IV summarizes recommendations for future activities in support of small hydro in North Carolina. Appendices include a list of existing and potential hydroelectric sites in North Carolina, a computerized list of power potentials at existing dams in North Carolina, a list of parties interested in small hydro, a sample letter sent to small hydro developers, and the program for a small hydro conference held in Asheville in 1979. Voltage Gradients in Solar Array Cavities as Possible Breakdown Sites in Spacecraft-Charging-Induced Discharges.
N. J. Stevens, H. E. Mills, and L. Orange. 1981, 10p
NASA-TM-82710, E-1003
Presented at the Ann. Conf. On Nucl. And Space Radiation Effects, Seattle, 21-24 Jul. 1981.

A possible explanation for environmentally-induced discharges on geosynchronous satellites exists in the electric fields formed in the cavities between solar cells - the small gaps formed by the cover slides, solar cells, metallic interconnects and insulating substrate. When exposed to a substorm environment, the cover slides become less negatively charged than the spacecraft ground. If the resultant electric field becomes large enough, then the interconnect could emit electrons (probably by field emission) which could be accelerated to space by the positive voltage on the covers. An experimental study was conducted using a small solar array segment in which the interconnect potential was controlled by a power supply while the cover slides were irradiated by monoenergetic electrons. It was found that discharges could be triggered when the interconnect potential became at least 500 volts negative with respect to the cover slides. Analytical modeling of satellites exposed to substorm environments indicates that such gradients are possible. Therefore, it appears that this trigger mechanism for discharges is possible.

Investigation of Direct Solar-to-Microwave Energy Conversion Techniques.
Final Report.
N. E. Chatterton, T. K. Mookherji, and P. K. Wunsch. Jan 78, 107p NASA-CR-161883, ESD-78-MSFC-2174
Contract NAS8-32643

Identification of alternative methods of producing microwave energy from solar radiation for purposes of directing power to the Earth from space is investigated. Specifically, methods of conversion of optical radiation into microwave radiation by the most direct means are investigated. Approaches based on demonstrated device functioning and basic phenomenologies are developed. There is no system concept developed, that is competitive with current baseline concepts. The most direct methods of conversion appear to require an initial step of production of coherent laser radiation. Other methods generally require production of electron streams for use in solid-state or cavity-oscillator systems. Further development is suggested to be worthwhile for suggested devices and on concepts utilizing a free-electron stream for the intraspace station power transport mechanism.

Processing of Silicon Solar Cells by Ion Implantation and Laser Annealing.
Final Report.
J. A. Minnucci, K. W. Matthei, and A. C. Greenwald. Feb 81, 78p NASA-CR-165283, FR-10066
Contract NAS3-21276

Methods to improve the radiation tolerance of silicon cells for spacecraft use are described. The major emphasis of the program was to reduce the process-induced carbon and oxygen impurities in the junction and base regions of the solar cell, and to measure the effect of reduced impurity levels on the radiation tolerance of cells. Substrates of 0.1, 1.0 and 10.0 ohm-cm float-zone material were used as starting material in

the process sequence. High-dose, low-energy ion implantation was used to form the junction in n+p structures. Implant annealing was performed by conventional furnace techniques and by pulsed laser and pulsed electron beam annealing. Cells were tested for radiation tolerance at Spire and NASA-LeRC. After irradiation by 1 MeV electrons to a fluence of 10 to the 16th power per sq cm, the cells tested at Spire showed no significant process induced variations in radiation tolerance. However, for cells tested at Lewis to a fluence of 10 to the 15th power per sq cm, ion-implanted cells annealed in vacuum by pulsed electron beam consistently showed the best radiation tolerance for all cell resistivities.

The Effects of Impurities on the Performance of Silicon Solar Cells.
K. A. Yamakawa. 1 Sep 81, 75p NASA-CR-164945, JPL-PUB-81-76
Contracts NAS7-100, EX-76-A-29-1012

The major factors that determine the tolerable concentrations of impurities in silicon feedstock for solar cells used in power generation are discussed in this report. It is concluded that a solar-grade silicon can be defined only for a specific manufacturing process. It is also concluded that it is the electrical effects, efficiency and resistivity, that are dominant in determining tolerable concentrations of impurities in the silicon feedstock. Crystal growth effects may become important when faster growth rates and larger crystal diameters are developed and used.

Presented at the 16TH Intersoc. Energy Conversion Conf., Atlanta, 9-14 Aug. 1981.

The PEP is a 32 kilowatt flexible substrate, retrievable, solar array system for use on the Space Shuttle. Solar cell costs will be reduced by increasing cell area and simplifying cell and coverglass fabrication processes and specifications. The cost goal is to produce cells below $30 per watt. Two and ten ohm-cm silicon cells were investigated. In phase I of the cell development program a few thousand candidate cells will be produced and evaluated for utility and quality. In phase II a large number of cells will be fabricated to verify production readiness and cell yields and costs. This schedule is compatible with PEP initial operational capability in 1984. Approximately 140,000 large area (5.9 x 5.9 cm) cells will be required for two PEP solar arrays. The status of the cell development and testing, including a radiation damage test and side-by-side comparison of candidate cell types with pre- and post-irradiation airplane calibration of outer space short-circuit current, is reported.

Cogeneration Feasibility Study in the Gulf States Utilities Service Area.
Dec 79, 536p
Contract W-7405-ENG-26

Sites in the Gulf States Utilities service are considered for cogeneration feasibility studies. The sources of steam considered for the Orange, Texas and Geismar, Lake Charles, and North Baton Rouge, Louisiana sites include oil, coal, HTGR steamers, consolidated nuclear steam system, atmospheric fluidized-bed coal combustion, and coal gasification. Concepts concerning cogeneration fuel systems were categorized by technical applicability as: current technology (pulverized coal-fired boilers and fuel oil-fired boilers), advanced technology under development (HTGR steamers and the CNSS), and advanced technology for future development (atmospheric fluidized-bed boilers and coal gasification). In addition to providing data on cogeneration plant generally useful in the US, the study determined the technical and economic feasibility of steam and electric power cogeneration using coal and nuclear fuels for localized industrial complexes. Details on site selection, plant descriptions, cost estimates, economic analysis, and plant schedule and implementation. (ERA citation 05:013819)

Cogeneration Institutional Study in the Geismar, LA, and Orange, Texas Areas.
Dec 78, 199p
Contract W-7405-ENG-26

The objective of this report is to provide a better understanding of the institutional problems involved in the use of coal-fueled cogeneration. The viewpoints of industry, utilities, and government were probed extensively through indepth confidential interviews. To provide a real-life basis for this investigation, two existing industrial sites in the Gulf Coast area were studied. The projected effects of the installation of coal-burning cogeneration plants supplying steam and electricity to several industries, replacing existing oil and gas burning boilers, were studied for each site. This report provides insights into the overall institutional problem that will be useful at other locations. It covers the regulatory, economic, financial, engineering, operating, contractual, and corporate relations aspects of cogeneration. It concludes with suggestions for future action by the Federal government, state governments, industries, and utilities that should be helpful in removing the institutional constraints that are retarding cogeneration installations and the use of coal. Assessment of an Atmospheric Fluidized-Bed Coal-Combustion Gas-Turbine Cogeneration System for Industrial Application.
R. L. Graves, R. S. Holcomb, and J. R. Tallackson.
Oct 79, 182p
Contract W-7405-ENG-26

This study was initiated to provide information on the future potential industrial market for a cogeneration system consisting of a fluidized-bed coal combustor coupled to a gas-turbine (Brayton cycle) power system that uses air as the working fluid. In assessing the potential applications for the system, the process heat energy consumption by industry is identified, with special detail included on the six most energy-intensive industries. The potential impact on the nation's oil and natural gas consumption that would result from widespread utilization of coal for process heat is also estimated. The fraction of industrial process heat that the system could feasibly satisfy from a thermodynamic viewpoint is estimated, and the performance (potential fuel efficiency and heat/power ratio) of the atmospheric fluidized-bed gas-turbine system is calculated. Also treated are several specific case studies of industries in which the system could be incorporated. Major parameters are specified, and flow sheets are derived for systems that would satisfy the heat and power requirements of the process or industry. The overall fuel utilization efficiency, thermal power rating, and potential number of installations are specified for these case studies. The findings of the study indicate that there is a sizable potential market for the system, with over 1000 possible installations disclosed after reviewing only 8 specific industries from 6 major Standard Industrial Classification (SIC) groups. The potential displacement of oil and gas by coal in process heating is shown to be about 1.60 m exp 3 /sec (870,000 bbl/d) of oil and 4590 m exp 3 /sec (14.0 billion ft exp 3 /d) of natural gas for all industries combined. Continued development of the fluidized-bed coal combustor and power system is recommended so that this potential may be at least partially realized. (ERA citation 05:004470)

A Two-Dimensional Study of the Maximum Power That Can Be Obtained from a Wind Turbine in a Wind Shear Layer,
Bo C. A. Johansson. Apr 81, 62p FFA-134

In 1926 Albert Betz derived a one-dimensional stream tube theory for the maximum power that can be obtained from a wind turbine in a uniform flow. However, for modern large wind turbines there is a considerable velocity gradient in the approaching flow, since the wind flow field above the ground normally is a shear layer with a velocity profile reminding of that of a boundary layer of a wing or a flat plate. The present study extends Betz' theory to a two-dimensional case, where the undisturbed velocity field is given and allowed to vary arbitrarily vertically, and the location of the wind turbine is given. The maximum power is calculated by the method of calculus of variations. It is found that for common wind velocity profiles the maximum power is only slightly larger than the power, which is obtained by a constant relative wind speed retardation, equal to Betz' retardation, while for a linear velocity profile there is a considerable difference.

Pore Size, Zinc Penetration, and Zinc Diffusion Studies on PPQ/CA Separators.
Research and development rept.,
Isaac Angres, and Wendy Parkhurst. 2 Feb 81, 38p
Rept no. NSWC/TR-80-319

Studies were performed of some properties of co-polymeric polyphenylquinoxaline/cellulose acetate (PPQ/CA-60/40) membranes that are candidate separator materials for secondary alkaline batteries. Pore size measurements were obtained by bubble pressure, mercury porosimetry and electron microscopy methods. Zinc penetration measurements and measurements of zinc ion diffusion through the membrane were obtained in aqueous potassium hydroxide media using standardized electrolysis methods. For comparison purposes, dendrite penetration and zinc diffusion measurements were also obtained for two conventional cellulosic separator materials. It was concluded that the methods chosen are valid and useful for assessing the quality of separator materials. It was also concluded that PPQ/CA-60/40 membranes compare favorably with conventional separator materials. (Author)

Temperature Limitations of Alkaline-Battery Electrodes. Part 1. The Electrochemical Kinetic Behavior of Iron, Nickel, and Zinc in Concentrated Sodium Hydroxide Solutions. Final Report.
M. C. H. McKubre, and D. D. Macdonald. Nov 79, 208p DOE/ET/25425-T1
Contract AC01-78ET25425

The electrochemical kinetic properties of the metals iron, nickel, and zinc have been studied in concentrated electrolyte, in the temperature range -20 exp 0 to 120 exp 0 C. Three electrolyte concentrations have been examined for iron and nickel, corresponding to 20, 24, and 28 wt % NaOH. Zinc has been studied in detail only in the highest concentration. The principal tools and methods used in this study were single and repetitive sweep voltammetry, potential step and potential sweep coulometry, and the use of rotating ring disk electrodes. From a comprehensive survey of the dependence of cyclic voltammagrams on the potential sweep rate, we have been able to document the kinetic limitations imposed by Ni and Fe electrodes as a function of temperature. The major temperature limitations found are associated principally with irreversible electrode reactions; electrode dissolution (Fe and Zn), electrolysis (Fe and Ni), and irreversible components of film growth (Fe and Ni). In addition, Zn was found to undergo a temperature-dependent passivation process, which results in current oscillation under high load conditions. (ERA citation 06:034929)

Reactive Metal-Air Batteries for Automotive Propulsion. Final Report, August 1, 1978-November 30, 1979.
W. R. Momyer, and J. L. Morris. 20 Dec 79, 174p
Contract ET-78-C-03-1872

Lithium-water-air (Li-H sub 2 O-air) cells with electrode areas of 500 cm exp 2 were discharged in an acrylic cell casing designed specifically for this purpose. Numerous cells were discharged in lithium hydroxide (LiOH) electrolyte at an electrolyte temperature near 25 exp 0 C. Power output was regulated by controlling the LiOH concentration in the electrolyte. The cells were normally discharged at voltages from 2.0 to 2.3 V and current densities ranging from 50 to 200 mA/cm exp 2 . The design power density of 0.4 W/cm exp 2 was achieved at Li current efficiencies near 90 percent by the conclusion of the test program. The Li-H sub 2 O-air electrochemical couple does not appear to exhibit any significant scaling factor in regard to either electrode area or the number of cells in the battery. A detailed investigation was carried out to determine the applicability of the aluminum-water-air (Al-H sub 2 O-air) cell concept as a power source for automotive propulsion. The characteristics of various candidate Al alloys were determined in both laboratory half-cell corrosion studies and full-cell discharge studies. Examination of the effect of variations in operational parameters of a subscale 50-cm exp 2 cell was accomplished, and the critical parameters were identified. Evaluation of candidate air cathodes from several sources was undertaken. Cathodes from only two sources were found to have adequate polarization characteristics; of these, only one possessed the durability desired for automotive applications. For a full cell, peak power density of 378 mW/cm exp 2 at 425 mA/cm exp 2 was obtained. At a nominal useful voltage of 1.3 V, the power density was 230 mW/cm exp 2 at 175 mA/cm exp 2 . Coulombic efficiencies of 90 percent were obtained. 48 figures, 9 tables. (ERA citation 05:030734)

Thermal Energy Storage Systems. Part I.
Final rept.,
P. W. O'Callaghan, I. E. Smith, S. D. Probert, and M. A. Bell. c1981, 143p EUR-7266-EN
Prepared in cooperation with Cranfield Inst. of Tech. (England).
Customers in the European Community countries should apply to the Office for Official Publications of the European Communities, B.P. 1003, Luxembourg.

Research into the use of saturated-solutions of inorganic salts for thermal energy storage has shown that energy densities of between 2 and 4 times that of thermal storage in water are attainable over the temperature interval 30C to 70C. The operation of a viable storage device depends on the ability to remove heat from the hot solution without supercooling and without fouling the heat exchanger. Two types of heat exchanger effectively fulfilled these requirements: one used a fluidized bed of coarse particles, the other was continuously mechanically cleaned. A small sized (46 liter) thermal store was constructed and tested. It showed a high degree of stratification and good agreement with predictions from a mathematical model. It appears to offer scope for development in terms of thermal performance, reliability, and cost.

Universal Binding Energy Relations in Metallic Adhesion.
J. Ferrante, J. R. Smith, and J. H. Rose. 1981, 16p
NASA-TM-82706, E-993
Presented at the Conf. On Aspects Microscopiques de l'Adhesion et de le Lubrication, Paris, 14-18 Sep. 1981.

Scaling relations which map metallic adhesive binding energy onto a single universal binding energy curve are discussed in relation to adhesion, friction, and wear in metals. The scaling involved normalizing the energy to the maximum binding energy and normalizing distances by a suitable comination of Thomas-Fermi screening lengths. The universal curve was found to be accurately represented by E*(A*)= - (1+beta A) exp (-Beta A*) where E* is the normalized binding energy, A* is the normalized separation, and beta is the normalized decay constant. The calculated cohesive energies of potassium, barium, copper, molybdenum, and samarium were also found to scale by similar relations, suggesting that the universal relation may be more general than for the simple free electron metals.

Vibrational Spectra of Oxygen- and Boron-Isotopically Substituted B2O3 Glasses.
Technical rept.,
Charles F. Windisch, and William M. Risen, Jr. 15 Sep 81, 43p Rept no. TR-81-02
Contract N00014-75-C-0883

The Raman spectra of 10B, 11B, 16O, 18O, and mixed isotopic compositions of B2O3 (gl) are reported. The 808/cm band assigned to the boroxol ring structure is found to shift upon oxygen isotope substitution, and not to depend on the boron mass. It is replaced by four bands, in the intensity ratio 1:3:3:1, in the case of the 50% 16O-50% 18O-containing material. On the other hand, the frequencies other principal bands depend on the masses of both boron and oxygen. The ca 1260/cm band, in particular, depends on the masses of both, and shifts without broadening upon partial oxygen substitution. The analysis of these data shows that both a local unit, behaving as predicted for the boroxol ring, and a continuous random network of connecting bonds are manifested in the spectra. (Author)

Microhardness, Friction and Wear of SiC and Si3N4 Materials as a Function of Load, Temperature and Environment.
Annual technical rept. no. 2, 1 Oct 79-30 Sep 80,
M. G. S. Naylor, and T. F. Page. Oct 80, 69p
Grant DA-ERO-78-G-010

Temperature - and load-variable microhardness tests have been used to study the changing incidence of plasticity and fracture in SiC, Si3N4 and Si materials as a function of specimen microstructure. The decrease of hardness with temperature was more marked for SiC than for Si3N4 materials, such that the room temperature superiority of SiC over most forms of Si3N4 (only PDSN (pyrolytically deposited Si3N4) has comparable room temperature hardness)) was not maintained above v approx. 600 C. The hardness/temperature curve for (111) single crystal Si was similar in form to those reported by previous workers. Microstructural influences on hardness were more pronounced in Si3N4 than in SiC. Grain boundaries were generally observed to cause softening, and often provided preferred fracture paths, especially in fine-grained materials and especially at high temperature (800 C). However, fracture toughness values were highest for fined-grained materials, probably due to crack deflection by grain boundaries.

Brittle Materials Design, High Temperature Gas Turbine.
Final rept. 1 Jul 71-31 Aug 79,
Arthur F. McLean, and Eugene A. Fisher. Mar 81, 234p AMMRC-TR-81-14
Contract DAAG46-71-C-0162, DARPA Order-1849

Starting in July 1971, the Defense Advanced Research Projects Agency (DARPA) sponsored a joint program with the Ford Motor Company to demonstrate and encourage the use of brittle materials in engineering design. The program, which was to be a total systems iterative approach to high temperature structural design with ceramics in highly stressed applications focused on the development of ceramic components for gas turbine application. A goal of 200 hours of engine or engine rig demonstration for representative duty cycle temperatures in a regenerated vehicular gas turbine was chosen, with uncooled ceramic components to operate at least 25 hours at 2500 F, considerably beyond the temperatures possible with uncooled metal components. The total systems approach included major efforts in ceramic design, materials development, fabrication process development, fabrication process development, and test and evaluation methodology. Considerable progress was made in each of these areas during the course of the program. For example, the strength of reaction bonded silicon nitride (RBSN) used in the stator and rotor blades was more than tripled between July 1971 and July 1977.

Silicon Carbide as an Oxidation-Resistant High-Temperature Material. 1: Oxidation and Heat Corrosion Behavior.
J. Schlichting. Aug 81, 11p NASA-TM-76608
Contract NASW-3199
Transl. into English from Ber. Dtsche. Keram. Ges., (Germany, F.R.). V. 56, No. 8, 1979 p 196-200. Transl. By Kanner (Leo) Associates, Redwood City, Calif.

The oxidation and corrosion behavior of SiC (in the form of a SiC powder) and hot-pressed and reaction-bound material were studied. The excellent stability of SiC in an oxidizing atmosphere is due to the development of protective SiO2 coatings. Any changes in these protective layers (e.g., due to impurities, reaction with corrosive media, high porosity of SiC, etc.) lead in most cases to increased rates of oxidation and thus restrict the field of SiC application.

NASA-CR-164959, JPL-PUB-81-16
Contracts NAS7-100, DE-AI01-81ET-20307

The fracture mechanics of cellular glasses (for the structural substrate of mirrored glass for solar concentrator reflecting panels) are discussed. Commercial and developmental cellular glasses were tested and analyzed using standard testing techniques and models developed from linear fracture mechanics. Two models describing the fracture behavior of these materials were developed. Slow crack growth behavior in cellular glass was found to be more complex than that encountered in dense glasses or ceramics. The crack velocity was found to be strongly dependent upon water vapor transport to the tip of the moving crack. The existence of a static fatigue limit was not conclusively established, however, it is speculated that slow crack growth behavior in Region 1 may be slower, by orders of magnitude, than that found in dense glasses.

Materials Analyses of Ceramics for Glass Furnace Recuperators.
G. W. Weber, and V. J. Tennery. Nov 79, 115p
Contract W-7405-ENG-26

The use of waste heat recuperation systems offers significant promise for meaningful energy conservation in the process heat industries. This report details the analysis of candidate ceramic recuperator materials exposed to simulated industrial glass furnace hot flue gas environments. Several candidate structural ceramic materials including various types of silicon carbide, several grades of alumina, mullite, cordierite, and silicon nitride were exposed to high-temperature flue gas atmospheres from specially constructed day tank furnaces. Furnace charging, operation, and batch composition were selected to closely simulate industrial practice. Material samples were exposed in flues both with and without glass batch in the furnace for times up to 116 d at temperatures from 1150 to 1550 exp 0 C (2100 to 2800 exp 0 F). Exposed materials were examined by optical microscopy, scanning electron microscopy, energy dispersive x-ray analysis, x-ray diffraction, and x-ray fluorescence to identify material degradation mechanisms. The materials observations were summarized as: Silicon carbide exhibited enhanced corrosion at lower temperatures (1150 exp 0 C) when alkalies were deposited on the carbide from the flue gas and less corrosion at higher temperatures (1550 exp 0 C) when alkalies were not deposited on the carbide; alumina corrosion depended strongly upon purity and density and alumina contents less than 99.8% were unsatisfactory above 1400 exp 0 C; and mullite and cordierite are generally unacceptable for application in soda-lime glass melting environments at temperatures above 1100 exp 0 C. (ERA citation 05:005926)

High Temperature Glass Thermal Control Structure and Coating.
Patent Application,
D. A. Stewart, H. E. Goldstein, and D. B. Leiser. Filed 2 Oct 81, 18p N82-10228/6, NASA-CASE-ARC-11164-1
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A high temperature stable and solar radiation stable thermal control coating either useful as such, applied directly to a member to be protected, or applied as a coating on a re usable surface insulation is discussed. The coating has a base coat layer and an overlay glass layer. The base coat layer has a high emittance, and the overlay layer is formed ffrom discrete, but sintered glass particles to give the overlay a high scattering coefficient. The resulting two-layer space and thermal control coating has an absorptivity-to-emissivity ratio of less than or equal to 0.4 at room temperature, with an emittance of 0.8 at 1200 F. It is capable of exposure to either solar radiation or temperatures as high as 2000 F without significant degradation. A reusable surface insulation structure in corporating the coating and having primary application as a space shuttle heat shield is also discussed.

MSC/TFR/1106/1103, NADC-78241-60
Contract N62269-79-C-0209

Usefulness of NDE methodology for assessing criticality of disbonds with two-dimensional planforms located in laminated Graphite/Epoxy composites has been examined. A linear elastic fracture mechanics approach, semi-empirical growth laws, and methods of stress analysis based on a modified laminated plate theory have been studied for assessing growth rates of disbonds in a transverse shear environment. Elastic stability analysis has been utilized for laminates with disbonds subjected to in-plane compression and/or shear. Results of nondestructive inspections and destructive tests have been correlated with analytical predictions. In addition, effects of moisture conditioning and cyclic loading on wave velocities and attenuation of sound in Graphite/Epoxy composites and in neat resin samples have been studied. (Author)

Environmental Failure of Adhesive Bonding in Composites.
Final rept.,
E. H. Andrews, Ho Ping Sheng, H. A. Majid, and C. Viachos. May 81, 48p
Grant DA-ERO-78-G-118

A recently developed fracture mechanics test (the A-S test), which involves pressurisation of an enclosed circular flaw, has been used to investigate the adhesion of two epoxy resins (Shell Epikote 828 and 3 M's SP 250) to glass. Specimens were tested after various times of immersion in water at 80 C and the adhesive failure energy theta determined. The effects of adding silane coupling agents to the epoxy resin and the influence of water pH were particularly studied. The theory of generalized fracture mechanics is used to derive, from theta, an intrinsic failure failure energy theta sub 0 which is the energy to break unit area of interatomic bonds across the interface. The decrease of theta sub 0 with time follows first order reaction kinetics, with a rate constant controlled by the type and concentration of coupling agent as well as by the pH of the aqueous environment. The results are interpreted in terms of the chemical hydrolysis of interfacial bonds. (Author)

Radiation Testing of Composite Materials, in Situ Versus Ex Situ Effects.
Final Report.
R. M. Kurland, J. F. Thomasson, and W. C. Beggs. Nov 81, 109p NASA-CR-3475, REPT-351710-6028-UT-01
Contract NAS1-15848

The effect of post irradiation test environments on tensile properties of representative advanced composite materials (T300/5208, T300/934, C6000/P1700) was investigated. Four ply (+ or - 45 deg/+ or - 45 deg) laminate tensile specimens were exposed in vacuum up to a bulk dose of 1 x 10 to the 10th power rads using a mono-energetic fluence of 700 keV electrons from a Van de Graaff accelerator. Post irradiation testing was performed while specimens were being irradiated (in situ data), in vacuum after cessation of irradiation (in vacuo data), and after exposure to air (ex situ data). Room temperature and elevated temperature effects were evaluated. The radiation induced changes to the tensile properties were small. Since the absolute changes in tensile properties were small, the existance of a post irradiation test environment effect was indeterminate.

Novel Improved PMR Polyimides.
R. H. Pater. 1981, 18p NASA-TM-82733, E-1045
Presented at the 13TH Natl. Sampe Tech. Conf., Mt. Pocono, PA., 13-15 Oct. 1981.

A series of N-phenylnadimide (PN) modified PMR polyimide composites reinforced with graphite fibers was investigated. The improved flow matrix resins consist of N-phenylnadimide (PN), monomenthyl ester of 5-norbornene-2, 3-dicarboxylic acid (NE), dimethyl ester of 3,3, 4,4-benzophenonetetracarboxylic acide (BTDE), and 4,4 methylenedianiline (MDA). Five modified PMR resin systems were formulated by the addition of 4 to 20 mole percent N-phenylnadimide to the standard PMR-15 composition. These formulations and the control PMR resin were evaluated for rheological characteristics. The initial thermal and mechanical properties of the PN modified PMR and the control PMR/Celion 6000 composites were determined. The results show that the addition of N-phenylnadimide to PMR-15 significantly improved the resin flow characteristics without sacrificing the composites properties.

Concentrations of 4 and 9 mole percent PN appear to improve the thermoxidative stability of PMR composites.

The Industrial Processing of Unidirectional Fiber Prepregs.
B. Laird. Jun 81, 18p NASA-TM-76599
Contract NASW-3199
Transl. Into English from Plastiques Renforces, Fibres de Verre Textile V. 19, Jul.-Aug. 1980 p 9-16. Original Language Document Announced as A80-44924. Transl. By Kanner (Leo) Associates, Redwood City, Calif. Original DOC. Prep. By Ciba-Geigy France, S. A.

Progress made in the industrial processing of preimpregnated composites with unidirectional fibers is discussed, with particular emphasis on applications within the aerospace industry. Selection of industrial materials is considered. Attention is given to the conditions justifying the use of composites and the properties required of industrial prepregs. The hardening cycle is examined for the cases of nonmodified and polymer modified resins, with attention given to the stabilization of flow, the necessary changes of state, viscosity control, and the elimination of porosity. The tooling necessary for the fabrication of a laminated plate is illustrated, and the influence of fabrication and prepreg properties on the mechanical characteristics of a laminate are indicated. Finally, the types of prepregs available and the processing procedures necessary for them are summarized.

Anisotropic Elastic Constants of a Fiber-Reinforced Boron-Aluminum Composite.
Final rept.,
S. K. Datta, and H. M. Ledbetter. 1980, 6p
Pub. in Proceedings of Mechanics of Nondestructive Testing, Blacksburg, Virginia, September 10-12, 1980, p215-230.

Elastic constants, both the C(ij)'s and the S(ij)'s, were measured and calculated for a laminated, uniaxially fiber-reinforced boron-aluminum composite. Three theoretical models were considered: square-array, hexagonal-array, and random-distribution. By combining several existing theoretical studies on randomly distributed fibers, a full set of elastic constants can be predicted for this model. The random-distribution model agrees best with observation, especially for off-diagonal elastic constants. Considering all nine elastic constants, observation and theory differ on the average by six percent.

Improvements in Department of the Interior Leasing of Potential Aluminum Resources Are Necessary for More Timely Decisionmaking.
10 Sep 81, 9p Rept no. GAO/EMD-81-135
See also Rept. no. GAO/EMD-81-44.

Excessive and unnecessary delays in processing alunite prospecting permit and preference right lease applications in several western states have frustrated development of a potential domestic aluminum resource. Exploration and development of such leasable nonfuel minerals as alunite cannot occur without Government approval. Thus, to allow inaction without formulating alternative means of allowing exploration and development automatically means there will be little or no activity. As the Department noted in responding to the results of our review, the Bureau of Land Management must coordinate adjudication and processing of mineral leasing activities with such surface management agencies as the Forest Service. The Department recognizes that, in such cases, the Bureau has less control in scheduling field examinations and environmental analysis. Further, the Department stated that, in some cases, permitees themselves do not aggressively pursue or react diligently to leasing requirements for economic, budgetary, or other internal reasons. The point is well taken--not all delay is attributable to Government slowness or indecision alone. This point should not, however, lead to a generalized assumption that unresponsiveness from any of the parties involved should be allowed to continue unchecked. We believe that neither lack of Government responsiveness nor insufficient permitee diligence should tie up disposition of valuable resources indefinitely, as appears to have been the case with alunite.

Thresholds for Fatigue Initiation and Propagation and Plastic Work in HY80 and HY130 Steels.
Annual technical rept. 1 Sep 80-31 Aug 81,
Morris E. Fine. 30 Oct 81, 14p
Contract N00014-78-C-0565

The effect of tempering temperature on the fatigue crack propagation rate (FCPR) in the low stress intensity range of HY130 austenitized at 815 C was determined. Four treatments giving the same hardness, R.C. 34, were selected: A - 10 hrs at 400 C, B - 5 hrs at 550 C, C - 1 hr at 610 C and D - 1/4 hr at 650 C. Treatment C, the standard treatment for HY130, gave the highest value of stress intensity threshold, Delta Kth, and the lowest propagation rate at Delta K of 5 MPa square root of m. For HY80 intercritical heat treatments were developed to give desired distributions of ferrite and martensite for measurement of Delta Kth.

Dynamic J sub i-R Curve Testing of HY-130 Steel.
Research and development rept.,
J. A. Joyce, and E. J. Czyryca. Oct 81, 35p Rept no. DTNSRDC/SME-81/57

The J-integral crack growth resistance properties of HY-130 steel were developed under dynamic loading conditions. The objective of this program was to extend the key curve method to evaluate ductile fracture properties of HY-130 steel compact specimens where the loading rate produced a load-line crack-opening displacement rate on the order of 9-inches per second. A key curve for HY-130 plate was developed under dynamic loading conditions using subsized specimens and was applied to tests of 1TCT Specimens. Results of ambient temperature tests showed that both J sub Ic and the tearing modulus of this steel were substantially elevated under dynamic loading. The fracture process of specimens tested under dynamic and static loading conditions was found to be similar and completely ductile. (Author)

A Fracture Limit Diagram for Determining Hydrogen Embrittlement of Sheet under Multiaxial Loading Conditions.
Technical rept.,
R. J. Bourcier, and D. A. Koss. Sep 81, 14p Rept no. TR-16
Contract N00014-76-C-0037

The application of punch-stretch testing as a means of determining hydrogen embrittlement of sheet under multiaxial loading conditions is described. The results may be expressed in the form of a fracture limit diagram which identifies at fracture the principal strain components in the plane of the sheet for any multiaxial deformation path associated with a thinning of the sheet. As an illustration, a fracture limit diagram is reported for internally charged, commercially pure titanium sheet. The diagram clearly shows that the titanium is susceptible to hydrogen embrittlement under plane strain and biaxial loading paths even though no loss of ductility occurs in simple tension. (Author)

Localized Necking: An Inclined Imperfection Model.
Technical rept.,
K. S. Chan, A. K. Ghosh, and D. A. Koss. Jul 81, 29p Rept no. TR-15
Contract N00014-76-C-0037
Prepared in cooperation with Stanford Univ., CA. Dept. of Materials Science and Engineering. and Rockwell International, Thousand Oaks, CA. Science Center.

The Marciniak and Kuczynski (M-K) analysis, which associates localized necking in sheet metal with pre-existing imperfections, has been modified such that the imperfection or groove is inclined (rather than normal) to the major principal strain axes. The analysis, which is closely related to the calculations of Hutchinson and Neale, takes into account the requirement for localized necking that a direction of zero-extension is inclined for strain states between uniaxial tension and plane strain. Based on the inclined imperfection model, calculations are presented for the negative minor strain regime of a forming limit diagram showing the dependence of localized necking on work hardening, strain rate sensitivity, plastic anisotropy, and imperfection factor. Theoretical calculations of forming limit curves indicate good agreement between the model and previously obtained experimental data for several alloys. Such agreement is obtained for realistically small imperfections, although the limit strains predicted by the model itself are relatively insensitive to the magnitude of the imperfection. (Author)

Corrosion Fatigue of Metals in Marine Environments.
State-of-the-Art,
C. E. Jaske, J. H. Payer, and V. S. Balint. Jul 81, 263p Rept no. MCIC-81-42

This book was prepared to document and review the major factors involved in corrosion fatigue of metals in marine environments. This includes both crack initiation and crack growth. Background information was obtained by searching technical literature through eight different sources--(1) Chemical Abstracts, (2) Metals Abstracts, (3) Metals and ceramics Information Center (MCIC), (4) Engineering Index, (5) Copper Data Center, (6) National Technical Information Service, (7) Defense Technical Information Service, and (8) Proceedings of Offshore Technology Conferences. Unpublished and proprietary papers and reports were excluded unless permission was obtained to release the results contained therein. Thus, most of the information was from documents published in the open literature. For convenient use and reference, discussions on corrosion-fatigue behavior are divided into separate chapters dealing with (1) carbon and alloy steels, (2) stainless steels, (3) nickel-base alloys, (4) copper-base alloys, (5) aluminum alloys, and (6) titanium alloys. Representative plots and tabulations of important data and factors influencing them are presented, but exhaustive plots and tabulations of all available data, such as might be found in handbooks, are not included because these are beyond the scope of this review. A general background for corrosion fatigue is presented in Chapter 2, which briefly discusses experimental procedures, general phenomena and mechanisms, variables affecting corrosion of metals in marine environments, and use of fatigue data in design.

Mechanisms of Recovering Low Cycle Fatigue Damage in Incoloy 901.
Doctoral thesis,
Robert E. Schafrik. 1979, 261p Rept no. AFIT-CI-79-212D

The effect of thermal treatment and hot isostatic pressing (HIP) on eliminating low cycle fatigue (LCF) damage in the iron-nickel superalloy, Incoloy 901, was investigated. Testing was done in air at 500 deg F at a total strain range of 0.75%. The mechanisms of crack initiation and crack propagation in baseline specimens were determined and used as the basis of comparison for the rejuvenated specimens. Crack initiation in the baseline specimens was due to decohering of blocky grain boundary carbides. Pre-crack initiation damage consisted of extrusions and intrusions formed at persistent slip bands and partially decohered grain boundary carbides. A pre-rejuvenation damage level of 800 cycles (60% of crack initiation) was selected. Some specimens to be HIP processed were ceramic coated; the rest were left uncoated. Post-HIP testing revealed that LCF properties were adversely affected by surface microstructural damage caused by the HIP processing. Thermal rejuvenation, consisting of a standard solution treatment and double aging, was partially successful in recovering fatigue properties with a pre-rejuvenation damage level of 800 cycles. Initiation life was extended by 400 cycles and cycles to failure was extended by 600 cycles. This behavior is explained in terms of microstructural damage which is resistant to thermal treatment. The Oxidation and Corrosion Resistance of Nitrided Iron Alloys.
Annual rept. no. 1 (Final) Apr 79-Mar 80,
K. H. Jack. 27 Jul 81, 30p
Grant DA-ERO-79-G-0035

Potentiokinetic measurements show that the corrosion resistance of austenitic Fe-34w/o Ni alloys containing Mo or Ti is increased by nitriding in NH3:H2 gas mixtures to form respectively a homogeneous distribution of 3Mo2N precipitates or a modulated structure of Ti-N clusters. Resistance to aqueous corrosion is also increased in alloys containing nitrogen in solid solution. A commercial nitrogen alloyed steel, Nitronic 50, which has excellent corrosion resistance in the annealed condition is heavily attacked when tested after removal of nitrogen. High temperature oxidation studies of ferritic iron alloys in static air have been completed. No significant differences in weight gain is detected between alloys tested in the annealed, the nitrided or the nitrided and aged conditions for Fe-5w/o Mo and Fe-2.32w/o Cr alloys but superior oxide adhesion is observed on nitrided pure iron and alloys containing a dispersion of incoherent nitrides. Experiments on nitrided mild steel oxidised at 600 C demonstrate the resistance to fracture of oxides formed on nitrided alloys. (Author)

Influence of Cyclic Load and Environmental Effects on Stress Corrosion Cracking of Sensitized Stainless Steel. Final Report.
E. L. White, and W. E. Berry. Aug 81, 62p EPRI-NP-1991

An experimental stress-corrosion cracking (SCC) study has been conducted in order to mitigate SCC in stainless steel piping in BWR's. Effect of the temperature, dissolved oxygen, and cyclic loading was studied on furnace sensitized Type 304 stainless steel. Slow strain rate tests at 4 x 10 exp -6 s exp -1 strain rate produced intergranular stress-corrosion cracking (IGSCC) at temperatures above 204 exp 0 C, suggesting a threshold temperature for IGSCC of about 130 exp 0 C at the 0.2 ppM oxygen level. Saturated solutions of AgCl produced IGSCC in slow strain rate tests in both aerated (8 ppM O sub 2) and deaerated (< 0.06 ppM O sub 2) tests at temperatures as low as 85 exp 0 C. Results suggest a potential hazard in using Ag/AgCl reference electrodes. IGSCC also was produced by trapezoidal cyclic loading (5 min load/unload, 10 or 75 min at load). Tests in 8 ppM oxygen water with the 75 min hold cycle, minimum load of 0.1 yield strength (YS) and maximum load greater than YS, indicated a threshold temperature for IGSCC of 190 exp 0 C. Other cyclic load tests in 288 exp 0 C - 8 ppM oxygen water with minimum load of 0.1 YS and maximum load less than YS, produced IGSCC at maximum loads as low as 0.7 YS in the rather high yield strength material studied (YS = 36.3 ksi at 288 exp 0 C). Low increment load cyclic loading produced IGSCC with cyclic loads ranging between 0.5 and 0.6 YS and 0.8 to 0.9 YS, but not at 0.6 to 0.7 YS or 0.7 to 0.8 Ys. The short hold cycle (10 min at load) was much less aggressive in promoting IGSCC than the long hold cycle (75 min at load). (ERA citation 06:035187)

Swelling and Microstructure of HFIR Irradiated Austenitic Stainless Steels.
P. J. Maziasz. 1980, 16p CONF-8009179-3
Contract W-7405-ENG-26
ADIP program review meeting, Germantown, MD, USA, 30 Sep 1980.

The swelling and microstructural information available from HFIR-CTRs-9-13 are summarized and compared for CW 316 and CW(316 + Ti). These experiments were irradiated to moderate fluences of about 8 to 16 dpa and 500 to 1000 at. ppM He at irradiation temperatures ranging from 285 to 670 exp 0 C. These results are compared to higher fluence HFIR irradiation of CW 316 from HFIR-CTRs-2-8 irradiated at 375 to 680 exp 0 C at fluences up to 61 dpa and 4200 at. ppM He. Both the high- and low-fluence cavity volume fraction swelling curves for CW 316 have a similar shape. The curves show a definite swelling minimum at 470 to 570 exp 0 C that corresponds to the temperature of maximum precipitation. The swelling increases rather sharply with temperature at the higher and lower temperatures. The moderate fluence swelling levels are all below 0.5% delta V/V sub 0 . (ERA citation 06:035727)

Post Irradiation Dose Determination of 800 MeV Proton Irradiated Aluminum from LAMPF Experiment 407.
W. F. Sommer. May 80, 14p
Contract W-7405-ENG-36

Recorded here are the results of post irradiation radiochemistry analysis of 800 MeV proton irradiated ultra high purity aluminum. Standard gamma-ray counting equipment, including a Ge Li detector, a multichannel analyzer, and associated electronics, was employed to count the exp 22 Na activity in the activated aluminum. Since activation is proportional to proton fluence, relative dose levels can be determined. Also, use of a selected production cross section for exp 22 Na in aluminum and a calculated damage energy cross section, both for 800 MeV proton bombardment, allows determination of a calculated value for the number of displacements per atom (dpa) that the material received during an irradiation experiment at the Clinton P. Anderson Meson Physics Facility (LAMPF). It is felt that simple and sufficiently accurate post irradiation dose determination can be made when either the subject material is ultra high purity aluminum or if this material is provided as a monitor with other subject materials, the simplicity being that the transmutation product, isotope exp 22 Na, is relatively abundant and has a long half-life. Weldability of Thermally Grain-Refined Fe-12Ni-0.25Ti for Cryogenic Structural Applications.
D. E. Williams. Feb 80, 43p
Contract W-7405-ENG-48

The weldability of a research alloy designed for structural use in liquid helium temperature, cryogenic environments was investigated. Plates of iron-12 weight percent nickel-0.25 weight percent titanium were grain refined by the four-step, grain refining thermal treatment developed for this alloy and welded with Inconel Number 92 weld wire using the Gas Metal Arc (GMA) welding process with argon-15% helium gas shielding. Both a single pass and a double-sided, 2 pass electron beam (EB) weld were also made without filler metal addition. Weldments were radiographed and sectioned and the charpy V-notch specimens removed were tested at liquid nitrogen and helium temperatures. (ERA citation 05:024369)

Flaw Growth of 7075, 7475, 7050 and 7049 Aluminum Alloy Plate in Stress Corrosion Environments: 4-Year Marine Atmosphere Results.
Interim Report.
K. R. Hasse, and R. C. Dorward. 13 Oct 81, 63p
NASA-CR-161887, CFT-RR-81-15
Contract NAS8-30890

After nearly 53 months of exposure to marine atmosphere, crack growth in SL DCB specimens from 7075, 7475, 7050, and 7049-T7X plate has slowed to the arbitrary 10 to the -10 power m/sec used to define threshold stress intensity. Because some specimens appear to be approaching crack arrest, the importance of self-loading from corrosion product wedging as a

significant driving force for crack propagation in over-aged materials is questioned. Crack length-time data were analyzed using a computer curve fitting program which minimized the effects of normal data scatter, and provided a clearer picture of material performance. Precracked specimen data are supported by the results of smooth specimen tests. Transgranular stress corrosion cracking was observed in TL DCB specimens from all four alloys. This process is extremely slow and is characterized by a striated surface morphology.

Failure Analysis of a Tool Steel Torque Shaft.
J. R. Reagan. 1981, 12p NASA-TM-82758, E-1077
Presented at the Conf. On Deformation, Fracture, Wear and Nondestructive Evaluation of Mater., New Orleans, 23-24 Nov. 1981; Sponsored by AM. Phys. Soc. And Nat. Bureau of Standards.

A low design load drive shaft used to deliver power from an experimental exhaust heat recovery system to the crankshaft of an experimental diesel truck engine failed during highway testing. An independent testing laboratory analyzed the failure by routine metallography and attributed the failure to fatigue induced by a banded microstructure. Visual examination by NASA of the failed shaft plus the knowledge of the torsional load that it carried pointed to a 100 percent ductile failure with no evidence of fatigue. Scanning electron microscopy confirmed this. Torsional test specimens were produced from pieces of the failed shaft and torsional overload testing produced identical failures to that which had occurred in the truck engine. This pointed to a failure caused by a high overload and although the microstructure was defective it was not the cause of the failure.

Fossil Energy Materials Needs Assessment.
R. T. King, and R. R. Judkins. Jul 80, 144p
Contract W-7405-ENG-26

An assessment of needs for materials of construction for fossil energy systems was prepared by ORNL staff members who conducted a literature search and interviewed various individuals and organizations that are active in the area of fossil energy technology. Critical materials problems associated with fossil energy systems are identified. Background information relative to the various technologies is given and materials research needed to enhance the viability and improve the economics of fossil energy processes is discussed. The assessment is presented on the basis of materials-related disciplines that impact fossil energy material development. These disciplines include the design-materials interface, materials fabrication technology, corrosion and materials compatibility, wear phenomena, ceramic materials, and nondestructive testing. The needs of these various disciplines are correlated with the emerging fossil energy technologies that require materials consideration. Greater emphasis is given to coal technology - particularly liquefaction, gasification, and fluidized bed combustion - than to oil and gas technologies because of the perceived inevitability of US dependence on coal conversion and utilization systems as a major part of our total energy production. Metallurgical and Mechanical Properties of Thorium-Doped Ir-0.3% W Alloys.
C. T. Liu, H. Inouye, and A. C. Schaffhauser. Apr 80, 22p
Contract W-7405-ENG-26

Metallurgical and mechanical properties of Ir-0.3% W alloys have been studied as a function of thorium concentration in the range 0 to 1000 ppM by weight. The solubility limit of thorium in Ir-0.3% W is below 30 ppM. Above this limit, the excess thorium reacts with iridium to form second-phase particles. Thorium additions raise the recrystallization temperature and effectively retard grain growth at high temperatures. Tensile tests at 650 exp 0 C show that the alloy without thorium additions (undoped alloy) fractured by grainboundary (GB) separation, while the alloys doped with less than 500 ppM thorium failed mainly by transgranular fracture at 650 exp 0 C. Intergranular fracture in the doped alloys is suppressed by GB segregation of thorium, which improves the mechanical properties of the boundary. The impact properties of the alloys were correlated with test temperature, grain size, and heat treatment. The impact ductility increases with test temperature and decreases with grain size. For a given grain size, particularly in the fine-grain size range, the thorium-doped alloys are much more ductile and resistant to GB fracture. All of these results can be correlated on the basis of stress concentration on GBs by using a dislocation pileup model. (ERA citation 05:020884)

Proceedings, U.S. Department of Commerce Public Workshop on Critical Materials Needs in the Aerospace Industry, February 9-10, 1981,
John B. Wachtman Jr. Jul 81, 700p NBSIR-81-2305

On February 9 and 10, 1981, the Department of Commerce held a Public Workshop to obtain the views of the American Public on three questions directly pertinent to the Department's responsibilities under the Materials and Minerals Policy, Research and Development Act of 1980, Public Law 96-479. These questions were: What are the materials issues of primary concern to he American aerospace industry and its suppliers; What recommendations do the American aerospace industry and its suppliers have for Federal action to address these issues; Which specific materials should the Department of Commerce review in detail over the next few months in order to recommend the most urgently needed programs for Federal action. The Workshop addressed these questions within three distinct areas: critical raw materials, critical engineering materials, and substitution, conservation, specialized recycling, and higher performance. This report includes the formal views presented to the plenary workshop sessions, the reports of the Workshop Task Forces in each of the three above areas, and the written submissions invited in the Federal Register notice of the Workshop.

Microcreep of Instrument Grade Beryllium.
Final rept.,
R. S. Polvani, and B. W. Christ. Jul 79, 5p
Pub. in SAMPE Quarterly 10, n4 p37-41 Jul 79.

Inertial guidance system gyroscopes and optical mirrors are designed to be dimensionally stable to better than 1 microinch over long times. New gyroscope designs require still better stability, 0.01 microinch. Uniaxial microcreep experiments at elevated temperature show instrument grade beryllium deforms in excess of both design limitations. However, a microstrain hardening process was observed that seems a possibility for improving microcreep strength. Performing these experiment required development of a test system with better than 0.1 microinch resolution, less than 0.01 microinch thermal noise in the signal at 144F, and typically, sample misalignment of about .00001 radians.

Determination of Sample Container Effects on Wearmetals Concentration in MIL-L-7808 Synthetic Lubricant Analyzed on an A/E35U-3 Fluid Analysis Spectrometer.
Final rept.,
R. S. Lee, R. Muthart, and E. Fox. Mar 79, 55p Rept no. JOAP-TSC-TR-79-001

This report presents a comparison of three sample containers commonly used with an A/E35U-3 Fluid Analysis Spectrometer. Data from the analysis of wearmetals in MIL-L-7808 synthetic lubricants was analyzed by several standard statistical techniques. These techniques were chosen to detect differences in analytical data and isolate variance that could be attributed to the sample containers. Results of these tests show that the sample containers tested can be used interchangeably and have negligible effects on the analytical method. (Author)

Engineering Design Handbook. Discontinuous Fiberglass Reinforced Thermoplastics.
Apr 81, 383p Rept no. DARCOM-P-706-314

This handbook provides information related principally to families of thermoplastics reinforced with strand 'E' glass. The handbook content, while limited to molding materials, advises the reader that other forms of thermoplastic materials-such as foams and elastomers-are also glass reinforced. The wealth of detail and information presented will acquaint US Army Materiel Development and Readiness Command personnel with the range of available materials and their unique mechanical, electrical, and physical properties; fabrication processes, including joining, together with their advantages and disadvantages; and areas of glass-reinforced thermoplastics (GRTP) application. Thus potential uses of GRTP's-with their attendant lower cost and ease of production-are suggested for the design and procurement of Army material. The handbook features the relationships between the GRTP's and their properties-the relationships are displayed both in tabular form and graphically. The influence of composite variables-volume of glass fiber; glass strand solids and bundle size; glass filament diameter, length, and orientation-on properties are similarly displayed. Another unique feature of the handbook is the manner in which the polymers and their associated properties are presented. In one breakout, the GRTP's are displayed as the independent variable; in a second breakout, the properties are displayed as the independent variable.

A Basic Computer Program to Calculate Moisture Content in Resins and Fibre Reinforced Resin Composites.
Technical memo.,
P. T. Curtis. Jun 81, 20p RAE-TM-MAT-375, DRIC-BR-79976

A basic language computer program is presented which calculates the moisture absorption of epoxy resin and fibre composite sheets from the sheet thickness, the diffusivity and the relative humidity of the environment. One-dimensional Fickian diffusion is assumed in the calculations. The program gives the water absorbed by the material in a given exposure time, together with the times for the material to absorb 95% and 99% of the maximum water uptake. In addition, the distribution of water through the laminate thickness is calculated and displayed graphically. The programme can be used for any resin or fibre composite in which the primary moisture diffusion mechanism is bulk diffusion through the resin. Examples for typical fibre reinforced epoxy composite laminates are given and the implications are discussed. Diffusion data for three materials at room temperature and two materials at 50 C are listed for use in the program. (Author)

Estimation of the Homogenization Temperature of a 1.2 Polybutadiene/1.4 Polybutadiene Diblock Copolymer Using Rheological Testing Methods.
Technical rept.,
R. E. Cohen, and M. -Y. Lin. 25 Oct 81, 22p Rept no. TR-9
Contract N00014-77-C-0311

Four samples containing various proportions of 1.2 and 1.4 polybutadiene were subjected to a series of rheological tests in which the dynamic storage modulus was determined over a range of temperature (30 C-160 C) and frequently (0.1-100 rad/sec). Isochronal plots of G' vs temperature showed that one of the samples (diblock 30/50, containing 38% 1, 2 polybutadiene) was substantially different in its rheological be-

havior. Appropriate treatment of the data revealed a 'rubberlike' plateau at low frequencies which began to disappear around 70 C and was completely missing at 100 C and above. From these results it was tentatively concluded that this sample undergoes a transition from a heterogeneous to a homogeneous morphology between 70 C and 100 C. (Author)

Battery Separators Based on Polyphenylquinoxaline Polymer Blends.
Final rept.,
Isaac Angres, Len Kowalchik, and Wendy Parkhurst. 1 Apr 81, 34p Rept no. NSWC/TR-81-17

This document is a final report on battery separators based on polyphenylquinoxaline (PPQ) polymer blends. The report describes the preparation of the polymer blends and their extrusion into membranes, reports a series of quality assurance tests for the membranes, and reports cycle life testing of the new membranes. The test results for the PPQ blend membranes are compared with the results obtained for standard separator membranes. It is concluded that PPQ/Cellulose Acetate is a good candidate material for alkaline battery separators; however, because of cost considerations, it is not competative with similar state-of-the-art materials. The Chemistry of Polyacetylene Doping.
Technical rept.,
T. C. Clarke, B. W. McQuillan, J. F. Rabalt, J. C. Scott, and G. B. Street. 31 Aug 81, 20p Rept no. TR-5
Contract N00014-80-C-0779

Natural abundance 13C Nuclear Magnetic Resonance experiments using cross polarization and magic angle spinning provide a unique method for monitoring the doping of polyacetylene. In contrast with previous authors we find that the doping of cis-polyacetylene with AsF5 leads, even at low doping levels, to a new signal characteristic of the doped regions of the polymer. Similar measurements on trans-polyacetylene indicate that the doping of the trans isomer proceeds considerably more uniformly than that of the cis isomer. Comparisons with appropriate model compounds suggest that the observed shift of the 13C NMR signal on doping is primarily a chemical shift rather than a Knight shift. Finally we discuss recent results on the nature of proton acid doping of polyacetylene, a process which shows remarkable similarities to oxidative doping. (Author)

Contract N00014-80-C-0779

Oxidized and neutral films of polypyrrole have been prepared electrochemically in the absence of oxygen and water. The neutral films are insulating and can be readily oxidized by chemical oxidizing agents to give films of greater conductivity than can be achieved by electrochemical oxidation. Optical spectroscopy provides evidence for the similarity of the polymeric carbonium ion produced by both types of oxidation. NMR studies are consistent with the alpha, alpha' bonding in these polymers; they also show the expected downfield shifts relative to the neutral polymer on both chemical and electrochemical oxidation. Electron Spin Resonance studies of both the electrochemically oxidized and the neutral polymer suggest the presence of highly mobile spins. (Author)

The Fracture of Thermosetting Resins after Exposure to Water.
Annual rept. no. 2,
Geoffrey Pritchard, R. G. Rose, W. E. Douglas, J. Ghotra, and D. Ho. Sep 81, 32p
Contract DAJA37-79-C-0505

This report considers the importance of molecular weight and molecular weight distribution in determining (a) the hydrolytic stability and (b) the fracture toughness of thermosetting resins. Experimental work (still incomplete) is described. Several orthophthalic polyester resins have been prepared and characterised, and some of them fractionated by precipitation with solvent: non-solvent mixtures. The fracture parameters, hot water resistance and property retention characteristics of the original resins are being compared with those of the fractions, with a two year period of immersion in distilled water at 50 deg C. Medium and high molecular weight fractions show improved hot water resistance. Molecular weight distributions are being measured by gel permeation chromatography and adjusted by combinations of synthetic, blending and fractionating procedures. (Author)

Miscible Polymer Blends Based on Polycarbonate and a Copolyester.
Final rept. 28 Sep 78-27 Sep 81,
D. R. Paul, and J. W. Barlow. 30 Sep 81, 12p ARO-15466.5-C
Grant DAAG29-78-G-0207

A thorough study was made of the thermodynamic, melt processing, mechanical property, environmental stability, and gaseous sorption and transport behaviour of a model miscible blend system comprised of Polycarbonate, PC, and a copolyester made from 1,4-cyclohexane dimethanol and a mixture of isophthalic and terephthalic acids. Generally the mechanical properties of this blend relative to those often observed for immiscible mixtures, are quite good and data have been developed which suggest that the interactions between polymer blend components responsible for miscibility are also responsible for deviations in blend moduli, strength, density, ductility, Henry's Law portion of gas sorption, and in gas permeation rates, relative to those expected for purely additive behavior. this miscible blend system was found to exhibit some interesting chemical phenomena. When annealed just below its melting point, Tm, the copolyester was found to undergo crystallization induced chemical rearrangements, CICR, which resulted in abnormally high levels of crystallinity and crystalline melting points.

The Stability of New Transparent Polymeric Materials: The Epoxy Trimethoxyboroxine System. Part 1: The Preparation, Characterization and Curing of Epoxy Resins and Their Copolymers.
Final Report.
E. Pearce, and S. C. Lin. 1981, 58p NASA-CR-164951
Grant NSG-2182

The effects of resin composition, curing conditions fillers, and flame retardant additives on the flammability of diglycidyl ether of bisphenol-A (DGEBA) as measured by the oxygen index is examined. The oxygen index of DGEBA cured with various curing agents was between 0.198 to 0.238. Fillers and flame retardant additives can increase the oxygen index dependent on the material and the amount used. Changes in the basic cured resin properties can be anticipated with the addition of noncompatible additives. High flame resistant epoxy resins with good stability and mechanical properties are investigated.

Method of Neutralizing the Corrosive Surface of Amine-Cured Epoxy Resins.
Patent Application,
S. Y. Lee. Filed 14 Aug 81, 9p N82-10227/8, NASA-CASE-GSC-12686-1
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

The corrosive alkaline surface layer of an epoxy resin product formed by the curing of the epoxy with an aliphatic amine is eliminated by first applying a non-solvent to remove most or all of the free unreacted amine and then applying a layer of a chemical reagent to neutralize the unused amine or amine functional groups by forming a substituted urea. The surface then may be rinsed with acetone and then with alcohol. The non-solvent may be an alcohol. The neutralizing chemical reagent is a monoisocyanate or a mono-isothiocyanate. Preferred is an aromatic mono-isocyanate such as phenyl isocyanate, nitrophenyl isocyanate or napthyl isocyanate.

Interferometric Study of Epoxy Resin Gelation.
K. R. Hirschbuehler. 1981, 28p CONF-8106158-1
Contract AC04-76DP00789
Office of Naval Research critical review: techniques for the characterization of composite materials, Cambridge, MA, USA, 8 Jun 1981.

The transition of epoxy resins from a mobile liquid to a rubbery gel is a complex process depending on chemical reaction kinetics and both heat and mass transfer. The purpose of this study is to determine the locus of initial gelation in an epoxy resin, and the course of gelatin through both neat resins and glass fiber/epoxy resin composites. This was accomplished by monitoring the local changes in refractive index in transparent epoxy castings using laser interferometry, supplemented by temperature profiles obtained from thermocouple arrays. These experiments were carried out on pure DGEBA epoxy (DOW DER-332) cured with a variety of primary amine, secondary amine, and anhydride curing agents. (ERA citation 06:035218)

Grant AFOSR-80-0211

In this effort further study was made of the implication of the higher order crossings on stationary time series and homogeneous random fields. The Higher Order Crossings Theorem has been extended to homogeneous random fields and the psi-square first introduced in the literature by the principal investigator has been further studied. In particular, since the Higher Order Crossings Theorem can be extended to random fields this suggests that psi-square can be used in texture discrimination which is indeed the case. The investigators have studied the power of psi-square via simulation techniques of series and fields. As the alternative becomes more distinguishable so is the increase in the power as expected. Another aspect studied is graphics in the series analysis. There is no theory of graphics as such, but the investigators were able to prove various graphical results by clipping a series by a random curve. In thic connection the investigators did some work in which the notion of a unit has been advanced in connection with the appearance of binary sequences. (Author)

A Model for Ordinal Nonhierarchical Cluster Methods.
Technical rept.,

M. F. Janowitz. Sep 81, 21p Rept no. TR-J8103
Contract N00014-79-C-0629

Hierarchical clustering involves the creation of a nested sequence of partitions of a set, whereas nonhierarchical clustering deals with a single partition. Nonhierarchical cluster techniques come up in a variety of situations involving such items as: (i) the assignment of stars to galaxies, (ii) the assignment of grades to students by an instructor; (iii) the classification of psychiatric patients by diagnostic type; (iv) the classification of rock formations: (v) the interpretation of LANDSAT images; (vi) automatic target detection; (vii) the grouping of companies according to properties that their stock might have in the stock market. It is not our purpose here to survey the literature in this area - rather, the reader is referred to standard references. As in our earlier model for hierarchical clustering, the viewpoint here will be that the input data has only ordinal significance. The order theoretic properties of the resulting model are offered in Section 2 and it will be related to some earlier theoretical work in Section 3. Finally, Section 4 presents an abstract characterization of the model in terms of semiBoolean algebras.

Maximum Likelihood Estimation of Magnitude-Squared Coherence.
Interim technical rept. Apr-Jun 81,
G. L. Mohnkern. 24 Aug 81, 16p Rept no. NOSC/TR-717

A maximum likelihood estimator (MLE) for coherence is derived. The MLE should be unbiased, and there should be no unbiased estimator with smaller variance. An approximation to the MLE, valid for coherence estimates with high degrees of freedom (dof), is also calculated. The two MLE algorithms and two estimators discussed in earlier literature are compared in a simulation of 8192 Calculators of coherence estimates with eight dof. The MLE calculations are consistently closer to the design coherences than the other estimators. The approximation to the MLE performs suprisingly well, considering the coherence estimates have only eight dof. (Author)

A Comparison of Procedures for Constructing Large Item Pools.
Research rept.,
Robert L. McKinley, and Mark D. Reckase. Aug 81, 64p Rept no. RR-81-3
Contract N00014-77-C-0097

The purpose of this study was to investigate the properties of available procedures for linking item parameter estimates. The properties investigated included sample size requirements, overlap requirements, and drift. From the analyses of these properties reported, the following conclusions were reached. When large sample sizes were employed, the use of LOGIST a-values with any of the procedures appeared to yield adequate results. The same was true for the linking of b-values using the 3PL model. The best combination for linking b-values was the use of LOGIST b-values with any of the linking procedures. When small sample sizes were used for the linking of a-values the best results were obtained using the major axis and least square procedures with either the ANCILLES or LOGIST a-values. Again, the results were the same for small sample size linking of b-values. The linking results using the small sample sizes were not as satisfactory as the results obtained using large sample sizes. The small sample sizes appeared to be inadequate for both a-value and b-value linking using the 3PL model. For the linking of 1PL b-values a sample size of 100 appeared adequate. Level of overlap did not seriously affect the results of linking for any of the procedures. However, it did appear that five items probably was not adequate. For the 15 and 25 item overlaps the results were quite similar, indicating that 15 items is probably sufficient overlap.

On the Expressive Power of Dynamic Logic. II,
Joseph Y. Halpern. Aug 81, 16p Rept no. MIT/LCS/TM-204
Grant NSF-MCS80-10707
Prepared in cooperation with Harvard Univ., Cambridge, Aiken Computation Lab.

In this paper we study the expressive power of nondeterminism in dynamic logic. In particular, we show that first order regular dynamic logic without equality (hereafter abbreviated DL) is more expressive than its deterministic counterpart (DDL). This result has already been shown for the quantifier-free case (MW) and for the propositional case (HR). Berman and Tiuryn have recently extended the present result to the case with equality. By contrast, Meyer and Tiuryn have shown in (MT) that in the r.e. case, deterministic and nondeterministic dynamic logic coincide. The proof hinges on showing that in a precise sense a deterministic regular program cannot search a full binary tree. Because of this, the truth of a first-order DDL formula, even with first-order quantification, cannot depend on every value in a full binary tree. From this it will follow that DDL is less expressive than DL. The kernel of the proof presented here can already be found in (HR). (Author)

SYMSAC '81 is the continuation of a well-established series of conferences sponsored or co-sponsored by ACM SIGSAM for the presentation of the latest advances in the field of symbolic and algebraic computation. The program consists of three invited talks, an invited banquet address, the presentation of thirty-nine submitted papers, two one-hour poster sessions, and demonstrations of various computer algebra systems. In addition, the Program Committee made a conscious effort to provide ample time and facilities for the informal exchange of ideas among the attendees.

Approximation of Processes and Applications to Control and Communication Theory,
Harold J. Kushner. Jun 81, 32p Rept no. LCDS-81-18
Contract N00014-76-C-0279, Grant AFOSR-76-3063
Sponsored in part by Grant NSF-ENG77-12946.

Diffusion models are useful and of widespread use in many areas of control and communication theory. The models are frequently used for systems that are not quite diffusions but are, hopefully, close to a diffusion in some sense. E.g., the input noise might be 'wideband'--but not 'white-Gaussian.' Many approximation techniques have been developed, under different sets of assumptions. The typical results are of a weak convergence nature. The physical process (x (to the epsilon power) (.)) is parameterized by the parameter epsilon, and one tries to show that (x (to the epsilon power) (.)) converges weakly to some diffusion x(.) as epsilon goes to 0. The limit process x(.) is then used to study various properties of x (to the epsilon power) (.) for small epsilon.

Determination of the Statistical Distributions of Model Parameters for Probabilistic Risk Assessment.
D. E. Fields, and S. R. Glandon. 1981, 11p CONF-810905-7
Contract W-7405-ENG-26
ANS/ENS topical meeting on probabilistic risk assessment, Post Chester, NY, USA, 20 Sep 1981.

Successful probabilistic risk assessment depends heavily on knowledge of the distribution of model parameters we have developed. The TERPED computer code is a versatile methodology for determining with what confidence a parameter set may be considered to have a normal or lognormal frequency distribution. Several measures of central tendency are computed. Other options include computation of the chi-square statistic, the Kolmogorov-Smirnov non-parametric statistic, and Pearson's correlation coefficient. Cumulative probability plots are produced either in high resolution (pen-and-ink or film) or in printerplot form. (ERA citation 06:035525)

Block Relaxation Strategies.
V. Faber. 1980, 6p CONF-800699-2
Contract W-7405-ENG-36
Elliptic problem solvers conference, Santa Fe, NM, USA, 30 Jun 1980.

It is desired to solve the linear system Ax = b, where the matrix A is n x n block tridiagonal with block size m. This system is to be solved by block line relaxation when the largest block problem with block size m that can be cheaply solved directly is l x l. Iteration steps, strategies, and results are summarized. It is concluded that the convergence rate of some block relaxation strategies is much faster than that of the strategies generally used. Boundary-Fitted Coordinate Transformation for Thermohydraulic Analysis in Arbitrary Three-Dimensional Geometries,
William T. Sha. Sep 81, 45p ANL-81-54

In order to solve the Navier-Stokes and energy equations, it is essential that the boundary conditions are represented accurately since the regions in the immediate vicinity of a boundary usually exhibit large temperature and velocity gradients, and these large gradi-

ents must be accurately accounted for. Most practical engineering problems involve body shapes that do not lend themselves to any one of the Cartesian, cylindrical or spherical coordinate representations. A method using boundary-fitted coordinate transformation is presented. It has the capability to transform arbitrary 3-D geometries in a physical domain to either a rectangular or cylindrical shape in the transformed space. The unique advantage of this transformation is that all physical boundaries are coincident with the computational grids; thus, it will give an accurate and efficient numerical solution to the Navier-Stokes and energy equations. A procedure for coordinate generation is outlined, and the transformed Navier-Stokes and energy equations with corresponding initial and boundary conditions are also presented.

Sponsored by NASA, Usda, Dept. Of Commerce, Dept. Of the Interior, and Agency for International Development. Erts.

The decomposition of mixture density of the data into its normal component densities is considered. The densities are approximated with first order dependent feature trees using criteria of mutual information and distance measures. Expressions are presented for the criteria when the densities are Gaussian. By defining different typs of nodes in a general dependent feature tree, maximum likelihood equations are developed for the estimation of parameters using fixed point iterations. The field structure of the data is also taken into account in developing maximum likelihood equations. Experimental results from the processing of remotely sensed multispectral scanner imagery data are included.

Estimation of Proportions in Mixed Pixels Through Their Region Characterization.
C. B. Chittineni. Mar 81, 38p E81-10199, NASA-CR-161001
Contracts NAS9-15800, PROJ. AGRISTARS
Sponsored by NASA, Usda, Dept. Of Commerce, Dept. Of the Interior, and Agency for International Development. Erts.

A region of mixed pixels can be characterized through the probability density function of proportions of classes in the pixels. Using information from the spectral vectors of a given set of pixels from the mixed pixel region, expressions are developed for obtaining the maximum likelihood estimates of the parameters of probability density functions of proportions. The proportions of classes in the mixed pixels can then be estimated. If the mixed pixels contain objects of two classes, the computation can be reduced by transforming the spectral vectors using a transformation matrix that simultaneously diagonalizes the covariance matrices of the two classes. If the proportions of the classes of a set of mixed pixels from the region are given, then expressions are developed for obtaining the estmates of the parameters of the probability density function of the proportions of mixed pixels. Development of these expressions is based on the criterion of the minimum sum of squares of errors. Experimental results from the processing of remotely sensed agricultural multispectral imagery data are presented.

A Second-Order Accurate Procedure for Solving the Boundary Layer Equations Based on the Predictor-Corrector Form of the Crank-Nicolson Scheme.
K. Matsuno. 1981, 10p NAL-TR-655, ISSN-0389-4010
In Japanese; English Summary.

The numerical accuracy of a predictor corrector form of the Crank-Nicolson scheme for solving boundary layer equations was investigated. A predictor corrector form of the Crank-Nicolson Scheme, based on a coupled algorithm for the continuity and the momentum equations, is presented for both the incompressible and the compressible flows. This scheme was subjected to a computer experiment by use of the problem of the laminar boundary layer development in a linearly retarded edge velocity field, and compared with another coupled scheme. It is shown that the present scheme posesses second-order accuracy and is very efficient.

Myers (Raymond H.), Blacksburg, VA.
Applications of Non-Parametric Statistics and Analysis of Variance on Sample Variances.
R. H. Myers. Sep 81, 98p NASA-CR-165789
NASA ORDER L-72497-A

Nonparametric methods that are available for NASA-type applications are discussed. An attempt will be made here to survey what can be used, to attempt recommendations as to when each would be applicable, and to compare the methods, when possible, with the usual normal-theory procedures that are avavilable for the Gaussian analog. It is important here to point out the hypotheses that are being tested, the assumptions that are being made, and limitations of the nonparametric procedures. The appropriateness of doing analysis of variance on sample variances are also discussed and studied. This procedure is followed in several NASA simulation projects. On the surface this would appear to be reasonably sound procedure. However, difficulties involved center around the normality problem and the basic homogeneous variance assumption that is mase in usual analysis of variance problems. These difficulties discussed and guidelines given for using the methods.

Inference Procedure with Uncertainty for Problem Reduction Method,
M. Ishizuka, K. S. Fu, and J. T. P. Yao. Aug 81, 43p CE-STR-81-24, NSF/CEE-81039
Grant NSF-PFR79-06296

In the application of artificial intelligence to complex decisionmaking problems, a decisionmaking tree is employed. Rational inference procedures for problem reduction are described which are based on either Bayes' theory or Dempster and Shafer's theory. At each branch of the decision tree, a probability is assigned to the evidence at that branch. In the Bayesian system, if there is a 75 percent probability that the evidence is true, for example, then there must be a 25 percent probability that the evidence is false. The Dempster and Shafer system allows for ignorance of evidence. A modification of the Bayesian, and Dempster and Shafer systems is presented which includes fuzzy reasoning, an approximate reasoning process which is compatible with human intuitions, and can yield a plausible answer even for problems in which all conditions for mathematical approaches are not satisfied. Fuzzy reasoning is presented as an alternative to statistical approaches in problem reduction.

Five Robust Indicators of Central Value,
P. J. Ellis. 14 Aug 81, 23p NIM-2121, ISBN-0-86999-549-9

The presence of outliers and the statistical noise that affects the data for reference materials have undesirable effects on the mean and on other indicators of the central value. Five robust indicators of the central value, which are resistant to obvious outliers and less obvious contamination (spurious data), were investigated: the dominant cluster mode, the modian, the Gastwirth median, the trimean, and the trimmed mean. The mean and the median were investigated for purposes of comparison. The results confirm that the mean is very unreliable, and that the Gastwirth median and the dominant cluster mode are strong indicators of the central value.

Recursive System Identification Using Fast Algorithms,
A. J. Robins, and P. E. Wellstead. Sep 79, 39p
CONTROL SYSTEMS CENTRE-459

This article shows how the class of so-called 'fast' (i.e. computationally efficient) estimation algorithms can be used in system identification. Commencing with a simplified derivation of a fast recursive parameter estimator, the discussion continues to cover the following points: The use of fast algorithms for the general model structures encountered in system identification from input/output data; The computational advantages and disadvantages of these allegedly computationally efficient methods; The theoretical basis for fast instrumental variable algorithms; and, The initialization and use of exponential memories in fast recursions. The article continues with practical examples of 'fast' identifiers at work in the least squares form (applied to feedback systems) and in the instrumental variable form.

Optimization of Stochastic Relay Control Systems by Means of Dimensional Analysis,
A. T. Fuller. 1981, 73p CUED/F-CAMS/TR-216-1981
Also pub. as ISSN-0309-765X.

Optimal feedback control is investigated for a second-order plant with white noise disturbances and with bounded control. The white noises are state-dependent, and the system is such that dimensional analysis can be applied with advantage. The optimal controller is found to be represented by a switching curve which is determined analytically to within a single parameter. To find the value of this parameter, the Bellman-Florentin partial differential equation of optimal stochastic control is converted to an ordinary differential equation by means of dimensional analysis, and a resulting two-point boundary-value problem is solved numerically.

Interactive Maximum Likelihood Estimation,
D. L. Prager, and P. E. Wellstead. Aug 79, 41p
CONTROL SYSTEMS CENTRE-458

This report describes an approach to maximum likelihood estimation which is based upon recursive hypothesis testing. The advantage of the method over existing hill-climbing and approximate recursive methods lies in the degree of information which can be obtained from the algorithm. In particular, cross-sections through the loss function are provided in a graphical form. This allows the analyst to see the likelihood function evolve, and make subjective decisions based upon this information. Effectively, the method computes all the relevant points on the loss function surface, making the technique ideal for short data runs where conditioning of the likelihood function is a problem. The method compares favorably with alternative maximum likelihood algorithms in terms of computational effort, and has none of their convergence problems.

Computation of Abscissa of Stability by Repeated Use of the Routh Test,
V. Zakian. Jan 78, 12p CONTROL SYSTEMS CENTRE-441

The numerical computation of the abscissa of stability of a polynomial, defined as the largest of the real parts of the zeros of the polynomial, is a problem that occurs repeatedly in computer aided design of dynamical and control systems. When the polynomial has a large number of zeros or is ill-conditioned, computing all the zeros is expensive or difficult. The approach developed in this paper, by making repeated use of the Routh test, avoids the computation of zeros and provides a method which is economical and reliable.

The Single and Multiple Vehicle Pickup and Delivery Problem: Exact and Heuristic Algorithms.
Doctoral thesis,
Gerald R. Armstrong. Jun 81, 201p Rept no. AFIT-CI-81-50D

The pickup and delivery problem (PUDP) represents a class of sequencing or routing problems where the key facet of the routing is that a pickup must precede the corresponding, subsequent delivery. Other considerations such as service time windows, quality of service parameters or operational constraints on either the driver or the vehicle are possible. As such, the PUDP is a constrained version of the ubiquitous travelling salesman problem (TSP), which seeks a minimum cost route that from an initial point visits each city or stop once and only once, ending at the initial stop. There are also similarities between the PUDP and the much studied vehicle routing problem (VRP), although the two problems are distinctly different because of the origin preceding destination requirement.

A variable metric, maximal ellipsoidal distance, relaxation method for solving systems of linear inequalities is described and its rate of convergence analyzed. This algorithm, with a termination routine appended to it, is polynomial if the ellipsoid matrix approximates an inverse 'Hessian,' which may be defined through the largest ellipsoid contained in a perturbation cum compactification of the feasible set. This so called inverse Hessian is given by a positive linear combination of symmetric rank one matrices built on the vectors given by the facets of the perturbation compactification of the feasible set. A 'Uniformity Principle' for Evacuation Route Allocation,
Richard L. Francis. 1 Apr 81, 5p
Included in Jnl. of Research of the National Bureau of Standards, v86 n5 p509-513, Sep-Oct 81.

This paper establishes what might be called a 'uniformity principle' for building evacuation problems. The principle may be stated as follows: given a building for which each occupant has reasonable access to every evacuation route, if the building is evacuated in minimum time, then the allocation of evacuees to routes is such that the route evacuation times are all the same. That is, there is a uniformity of route evacuation times. Also, analytical expressions for the minimum time to evacuate a building, and for the corresponding allocation of evacuees to routes, are obtained.

Energy-Efficient and Cost-Effective Equipment Should be Installed in New Government Housing.
16 Sep 81, 29p Rept no. GAO/EMD-81-93

This report discusses the efforts being made and the actions that could be taken to make Government housing more energy efficient. For the purpose of this report, Government housing is defined as that which is either entirely owned or assisted through direct subsidies, such as below-market interest rates, and housing financed by Government guaranteed or insured loans. Residential energy consumption accounts for about 20 percent of the Nation's energy use. Studies have shown that heating and cooling equipment, including water heaters, account for as much as 70 percent of the energy consumed in a house. Conservation efforts have concentrated on the thermal envelope (e.g., insulation, storm windows and doors, and infiltration) of new houses with little attention focused on the energy efficiency of equipment that provides needed space heating, air conditioning, and water heating. although most housing is privately financed and developed without Federal assistance in developing and financing new housing, can have a significant influence on reducing residential energy consumption. Under programs administered by the Department of Housing and Urban Development (HUD), the Veterans Administration (VA), the Farmers Home Administration (FmHA), and the Department of Defense (DOD), energy conservation practices can be fostered in Government owned, subsidized, and insured housing. HUD administers a variety of programs to help meet the Nation's need for decent housing for all Americans. During the last few years, HUD's single-family home mortgage programs have averaged approximately 100,000 new home starts each year.

Boiling Heat Transfer in Confined Space.
Annual technical rept. 1 Aug 80-1 Aug 81,
Shi-Chune Yao. Oct 81, 105p
Contract N00014-79-C-0623

In many equipments, boiling occurs in confined space such as the clearance between the tube and the support plate of steam generators. Corrosive concentration builds up at the boundary of dryout zone and induces severe damage. The knowledge on this kind of boiling phenomena is very limited. It is the objective of this research to understand this fundamental heat transfer of this problem through systematical analysis and experimental studies. This report covers the following aspects of the boiling in confined space: (1) Analysis of single phase forced convection in support plate crevices; (2) Analysis of convective boiling and dryout in support plate crevices; (3) Experiments of boiling and dryout in annular crevices with closed bottom; and (4) Experiments of convective boiling and dryout in annular crevices. Design Model for the Heat Transfer in a Short Straight Tube Boiler.
Master's thesis,
Leo W. Vollmer, Jr. Jun 81, 182p

A design model for the Short Straight Tube Boiler with a segmented fin-tube arrangement was developed. This model was integrated for a single tube applied in a computer program written in BASIC for the Hewlett Packard 9845 model B desk-top computer. Water-side Reynolds numbers were varied in order to investigate the performance of this boiler. For an overall tube length of 39.4 inches, a Reynolds number of 840 (29.65 lbm/hr) resulted in obtaining 50 deg superheat for an operating pressure of 600 psig. With these conditions, saturated boiling begins at 11.45 inches and superheating at 21.88 along the tube length. (Author)

Reducing Conventive Losses from Cover Glazings of Solar-Thermal Collectors.
P. Raghuraman, and D. Kon. 1981, 8p DOE/ET/20279-146, CONF-811101-9
Contract AC02-76ET20279
Winter annual meeting of the ASME Technology and Society Division, Washington, DC, USA, 15 Nov 1981.

Convective heat losses from cover glazings of solar thermal collectors are reduced by forming perpendicular crisscross rectangular grooves on the glazing which cause the air flow to form recirculating zones in the grooves. Experiments on the effects of varying groove geometry show that the cover-glazing convective heat-transfer coefficient can be reduced by a factor of four or better. Results of the experimental and analytical work and a description of the design considerations in optimizing the groove geometry are presented. (ERA citation 06:034621)

Simple Computer Program to Model 3-Dimensional Underground Heat Flow with Realistic Boundary Conditions.
P. D. Metz. 1981, 13p BNL-29776, CONF-811101-11
Contract AC02-76CH00016
Winter annual meeting of the ASME Technology and Society Division, Washington, DC, USA, 15 Nov 1981.

A FORTRAN computer program called GROCS (GRound Coupled Systems) has been developed to study 3-dimensional underground heat flow. Features include the use of up to 30 finite elements or blocks of earth which interact via finite difference heat flow equations and a subprogram which sets realistic time and depth dependent boundary conditions. No explicit consideration of moisture movement or freezing is given. GROCS has been used to model the thermal behavior of buried solar heat storage tanks (with and without insulation) and serpentine pipe fields for solar heat pump space conditioning systems. The program is available independently or in a form compatible with specially written TRNSYS component TYPE subroutines. The approach taken in the design of GROCS, the mathematics contained and the program architecture, are described. Then, the operation of the stand-alone version is explained. Finally, the validity of GROCS is discussed. (ERA citation 06:034566)

Passive Design for a Manufactured Classroom Building. Final Report.
31 Mar 81, 88p DOE/CS/30375-T1
Contract FC02-80CS30375

Work conducted by Madison Industries Inc. of Georgia and the Georgia Institute of Technology Engineering Experiment Station toward the development of passive solar heating systems for manufactured buildings is summarized. The specific application is a modular classroom building. Four passive system concepts were selected for space heating. These concepts are as follows: (1) direct gain; (2) water wall; (3) sunspace; and (4) integral collector wall. Designs were prepared for all four concepts. Thermal analyses were conducted, including annual heating simulations, for all designs. Typical weather and solar data for Atlanta were used in the simulations. In addition, design features for daylighting were incorporated in the building. (ERA citation 06:034596)

Steam Generator Chemical Cleaning: Demonstration Test No. 2 in a Pot Boiler.
G. L. Key, G. C. Fink, and M. H. Helyer. Aug 81, 91p EPRI-NP-1976

The effectiveness of the EPRI Mark II chemical cleaning solvent process was tested utilizing a 4-tube pot boiler that had previously been fouled and dented under 81 days of high chloride fault chemistry operation. One laboratory cleaning demonstration of 94.25 hours was performed. Essentially all of the low copper content (approximately 5%) sludge was removed. Approximately 38% of the previously fouled and dented tube/ring and tube/support crevice regions were effectively cleaned. Severe localized corrosion (predominantly pitting) was observed on A533 Grade A and A508 Class 2 carbon steels (nominal pit depths were 30 and 6 mils, respectively). General surface corrosion and/or minor pitting type corrosion was observed for all other materials tested (Types 405/409 stainless steels and AISI 1010 carbon steel), except for Inconel 600 specimens which had no indications of tube surface corrosion. (ERA citation 06:034836)

Passive-Solar Retrofit Concepts.
Sep 81, 49p MASEC-PA-81-030, P-102-4
Contract AC02-79CS30150

Four retrofit passive solar designs for single-family dwellings are presented. The first design, for a house in Minnesota, involves insulating wall cavities and the attic with blown cellulose, reduction of infiltration, and installation of insulating shades on all windows. The second, for a house in Michigan, combines weatherization, a sunspace with clerestory, and a thermosiphoning collector. The third, for a house in Missouri, involves the addition of a large sunspace with a passive solar hot water preheater for a hot tub. The fourth, for a house in Indiana, combines intensive weatherization with a two-story sunspace and thermal chimney addition. All designs are thoroughly illustrated. (ERA citation 06:034605)

Near-Term Improvements in Parabolic Troughs: An Economic and Performance Assessment.
R. Gee, and L. M. Murphy. Aug 81, 54p SERI/TR-632-870
Contract AC02-77CH00178

Improved parabolic-trough concentrating collectors will result from better design, improved fabrication techniques, and the development and utilization of improved materials. This analysis qualifies the performance potential of various parabolic-trough component improvements from a systems viewpoint and uses these performance data to determine the worth of each improvement on an economic basis. The improvements considered are evacuated receivers, silvered-glass reflectors, improved receiver, selective coatings, higher optical accuracy concentrations, and higher transmittance receiver glazings. Upper-bound costs for each improvement are provided as well as estimates of the increased solar system rates of return that are made possible by these improvements. The performance and economic potential of some of these improvements are shown to be substantial, especially

at higher collector operating temperatures. (ERA citation 06:034632)

Solar Energy Research at LASL. Progress Report, April 1-September 30, 1979.
S. R. Reisfeld, and D. A. Neeper. May 80, 77p
Contract W-7405-ENG-36

Solar energy research from April 1-September 30, 1979, performed by Los Alamos Scientific Laboratory's Group Q-11 in the areas of collector R and D and active and passive systems studies, is described. Accounts are also given of the Group's technical support to the Office of Solar Applications of the Department of Energy and of technology transfer to the scientific community, building industry, and the general public. The largest effort during this reporting period involved work on the Department of Energy (DOE) Passive Design Handbook. Other work in passive systems included a study of natural heat distribution mechanisms, further investigation of passive test rooms with special attention to the comparison between a room configured with a window-box collector and an adjoining direct-gain room, and computer calculations that develop a simplified method for predicting the behavior of an attached greenhouse. This method has been developed for direct-gain and storage-wall buildings. Research on solar collectors concerned testing the performance of both liquid and air heaters. The two-axis tracking collector test station is near completion and, with its high-temperature test loop, will permit testing of evacuated tube collectors from 200 to 500 exp 0 F. Data were collected on two of our active systems buildings, the National Security and Resources Study Center and the Nambe Community Building.Guidance was provided for DOE in funding actions for more than $500K in contract renewals and new projects as part of the technical support for collector R and D. The Q-11 Group Leader provided direct assistance at DOE Headquarters during a staff shortage from January-July. In addition to monitoring 75 collector research contracts, review meetings were established on both evacuated collectors and salt gradient solar ponds. (ERA citation 05:031998)

Contract W-7405-ENG-48
Conference on thermal performance of the exterior envelopes of buildings, Orlando, FL, USA, 3 Dec 1979.

This paper reports on the development and analysis of energy-performance standards for residential buildings in the United States. The approach involves an assessment of the economic costs and benefits of alternative standards and provides quantitative estimates of the reduction of energy use resulting from the implementation of standards. The sensitivities of building energy use to design parameters of buildings - including size, orientation, aspect ratio, basement type, window area, and construction material - are assessed. The DOE-2 Building Energy Utilization Analysis program was used to evaluate the heating and cooling loads of residential buildings. Residential buildings were simulated in ten weather climates using hourly weather data with a variety of energy-conservation measures. (ERA citation 05:016004)

Analysis and Simulation of Performance Data for Residential Solar Heating and Heat Pump System in Seattle, Washington. Final Report, Volume II.
R. Taussig, J. Lockett, M. Storie, J. Isakson, and B. Levy. 15 Jun 78, 328p
Contract EG-77-C-02-4229

In order to investigate the effect of the regional differences in solar energy availability on residential solar heating systems, a study was conducted to analyze the performance of a solar heated house in the Pacific Cascades and to validate a solar heating and heat pump computer simulation program for this region. The house, called the Seattle City Light Project Weathervane house, uses solar energy from roof-top flat plate collectors to boost the performance of a water-to-air heat pump. If the temperature of the water storage tank drops too low, then auxiliary heating is provided by an off-peak immersion heater. Performance data for the ten month heating season was collected from Seattle City Light, and put into the form of a comprehensive baseline data document. The University of Wisconsin TRNSYS solar heating computer simulation program was used to model the performance of the house. The computer results were compared to the actual performance data in order to help validate TRNSYS with regional solar heating data. The computer results were also used to help in understanding the behavior of the Seattle City Light Project Weathervane house heating system. Actual solar heating system performance demonstrates that approximately 40% of the total house heating requirements were provided by the solar heating system. The Solar Baseline Data are presented here. (ERA citation 05:015385)

Energy-Resource Requirements of a Solar-Heating System.
D. W. O. Rogers. Feb 79, 57p
U.S. Sales Only.

The methods of energy analysis have been applied to a liquid-based short-term storage solar space and water heating system suitable for a single family dwelling in Toronto. This system, which in many respects represents a worst case for solar heating, takes 1.0 to 3.5 years of operation to conserve the energy resources required to build, operate and maintain the system. Alternatively, over the twenty year lifetime of the system the energy resources used indirectly by the solar heating system amount to between 6 and 24% of the direct energy resources conserved by the system. These considerations do not significantly alter the energy conservation characteristics of the solar heating system unless thermally generated electricity is used as backup for a 50% solar heating system which replaces oil or gas heating - in this case only 4 to 9% of the energy resources are conserved by going solar. A factor of three variation in energy resource use in collector materials was found in a sample of 7 flat plate collectors with steel based collectors using the least. The total energy embodied in the collector was about double that found in the materials alone. The collectors and annual operating energy for the pumps were found to be the two most significant factors in the analysis. Appendices summarize the energy resource requirements embodied in the materials used for collectors and estimate the total energy resource requirements of conventional fuels delivered to the home. This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A device for use in passively cooling spaces, applicable to any level of thermal radiation in vacuum and to high-intensity thermal radiation in non-vacuum environments, is described. The device includes an enclosure nested in a multiplicity of thin, low-emittance, highly-reflective shields suspended in a casing in mutual angular relation and having V-shaped spaces for redirecting thermal radiation entering the sides of the shields. Successively reduced quantities of thermal radiation are reflected by the surfaces along substantially parallel paths extended through the V-shaped spaces to a common heat sink such as the cold thermal background of space.

Contract MA-RD-7-38010
See also Volume 1, PB-289 195.

This report is a summary of work performed by C-E under Task 2 & 3 of the Maritime Administration sponsored R&PD project entitled Marine Boiler Atomizer Optimization Through Improved Atomizer Performance Measurement Techniques. The objectives of Tasks 2 & 3 include use of the improved atomizer performance measurement techniques developed under Task 1 to define the performance of a typical commercially sized marine 'Y' jet atomizer operating at design conditions in a cold flow (non-combusting) spray chamber using a suitable test fluid. The effects of fuel temperature, viscosity, supply pressure, atomizing media temperature, pressure, and relative flow was also defined. A sensitivity study was also completed to define the optimum geometry for an 'X' jet atomizer and a methodology has been developed for sizing a range of commercially sized atomizers. Droplet ballistics information is also presented describing droplet velocities and trajectories for a typical marine atomizer.

Solar Industrial Process Heat Systems - An Assessment of Standards for Materials and Components,
Walter J. Rossiter, and Walter E. Shipp. Sep 81, 98p NBSIR-81-2381
Sponsored in part by Department of Energy, Washington, DC. Assistant Secretary for Conservation and Renewable Energy.

A study was conducted to obtain information on the performance of materials and components in operational solar industrial process heat (IPH) systems, and to provide recommendations for the development of standards including evaluative test procedures for materials and components. An assessment of the needs for standards for evaluating the long-term performance of materials and components of IPH systems was made. The assessment was based on the availability of existing standards, and information obtained from a field survey of operational systems, the literature, and discussions with individuals in the industry. Field inspections of 10 operational IPH systems were performed. The study did not address the thermal efficiencies and health and safety considerations of IPH systems.

Engineering - Economic Analysis of Improved Heat Pump Performance for Minimum Standards Development.
Final rept.,
Stephen R. Petersen, Kimberly A. Barnes, and George E. Kelly. Jul 81, 68p NBSIR-81-2241
Sponsored in part by Department of Energy, Washington, DC.

This report provides a methodology and seasonal performance data that could be used in the development of a reference basis for minimum efficiency standards for heat pumps that are economically justified on a life-cycle basis. Criteria for economic optimization are outlined. The methodology used to compute seasonal heating and cooling performance ratings and the annual energy savings resulting from efficiency improvements, by climate region, is detailed. The interdependence between efficiency ratings in the heating and cooling modes is explored using statistical analysis. An example of the procedure for determining maximum cost effective efficiency levels is demonstrated for a 36,000 Btu/h heat pump.

Customers in the European Community countries should apply to the Office for Official Publications of the European Communities, B.P. 1003, Luxembourg.

The development of a gas-fired heat pump based on the Rankine principle and using miniature turbomachinery is described. The need for a high-molecular weight working fluid is explained and tests carried out on candidate fluids are described. A computer program has been written to measure the effect of interactions between individual parameters and component efficiencies. A test-rig has been successfully operated over a three-year period and an economic analysis shows that the application of this gas-fired heat pump to a domestic situation could result in substantial savings in fuel costs.

R. L. Himmel, and R. E. Stack. Oct 81, 33p GRI-80/0079.1
Contract GRI-5080-345-0255
See also Volume 2, PB82-141086.

This report describes the efforts of a project aimed at improving the operating efficiency of gas-fired commercial cooking equipment, specifically, hotel and restaurant heavy duty range ovens. A conventional heavy duty range oven was modified to operate utilizing the principles of forced convective heat transfer not usually applied to range ovens. Efficiency improvements of 45 and 55 percent over conventional units have been demonstrated as well as reducing cooking time for light cake loads by 45 and 50 percent. Part of these improvements is due to the application of not only the forced convection principles, but also an infrared burner. Flue losses from the range ovens have also been reduced from about 80 percent to 53 and 29 percent depending upon the design.

High Temperature Metallic Recuperator.
Annual rept. May 80-Apr 81,
Michael E. Ward, Neil G. Solomon, and Charles E. Smeltzer. Jun 81, 130p SR81-R-4861-15, GRI-80/0074
Contract GRI-5080-342-0303

An industrial 4.5 MM Btu/hr axial counterflow recuperator has been designed and fabricated to deliver 1600F combustion air. This prototype recuperator has been designed to handle rapid cyclic loading, a long life, acceptable costs, and a low maintenance requirement. Two high temperature pre-heat burners have been purchased in order to measure their capabilities. These components were supplied by industrial burner manufacturers. A cost benefit analysis of a high temperature waste heat recovery system utilizing the recuperator developed by this project and components capable of 1600F combustion air preheat has shown that this system would have a payback period of less than two years. As part of the application and process survey, fifteen companies and industrial associations were interviewed. In general, there was great interest in recuperation in large energy consuming industries. Determination of long term environmental effects on candidate recuperator tubing alloys has been completed. Alloys found to be acceptable in the 2200F flue gas environment of a steel billet reheat furnace, were identified. This project year was the second year of effort in a three year plan to advance metallic recuperators for delivery of high quality air with the highest practical effectiveness.

Installation Guidelines for Solar Domestic Hot Water (DHW) Systems in One- and Two-Family Dwellings. Second Edition.
1980, 112p HUD-0002079, HUD/PDR-407(2)
Contract HUD-H-2377
Sponsored in part by the Department of Energy, Washington, DC.
Paper copy available from Supt. of Docs., Washington, DC 20402, order number 023-000-00520-4.

Written for the professional installation contractor and the skilled homeowner, this manual presents instructions for solar domestic hot water systems installation in single - family and two - family dwellings. Using these guidelines together with the manufacturer's manual, individuals should be able to install and fill their systems. The manual assumes knowledge of the basic skills of plumbing, wiring, roofing, carpentry, and masonry, as well as knowledge of paints, glazing, and insulation materials. It begins with discussions of startup, system layout, and siting and continues with procedures for roof mounting and ground mounting and for transfer fluids, piping, and ductwork. Additional chapters discuss insulation; pumps, valves, gages, and expansion tanks; heat exchangers and storage tanks; and system controls. Further chapters discuss checkout and chargeup of the system and mainte-

nance. A checklist to be consulted when doing the actual installation concludes the manual. Extensive photographs and diagrams are provided, and appendices present a glossary, about 30 references, a suggested list of tools, and HUD's minimum property standards which apply to dwellings equiped with solar heating and solar domestic hot water systems.

Survey of Passive Solar Buildings.
1979, 180p HUD-0002080, HUD/PDR-287(2)
Contract HUD-H-2384
Sponsored in part by the Department of Energy, Washington, DC.
Paper copy available from Supt. of Docs., Washington, DC 20402, order number 023-000-00437-2.

This publication describes passive solar buildings that have been constructed in the United States to date. The report's purpose is to offer a working definition and a basic understanding of a number of existing applications of passive solar designs. A passive solar heating and cooling system is defined as one in which thermal energy flows through a building by natural means. Its operation involves the control of the thermal energy flow and includes the ability to completely stop energy flow from entering or leaving the building. Sophisticated design is required to achieve operational efficiency. Three basic passive solar concepts are identified, each involving different relationships between the sun, the storage mass, and the living space. These concepts are direct gain (from sun to living space to storage mass); indirect gain (from sun to storage mass to living space); and isolated gain (from sun to collector space to storage mass to living space). Examples of indirect gain solar building are grouped into mass trombe, water trombe, and roof pond approaches. Variations of the isolated gain concept are illustrated by the thermosiphon building type and the sunspace building type as well as by several wall and window component systems. The buildings representing each type of passive energy application are listed and described with accompanying photographs and architectural plans. Passive solar cooling methods are briefly delineated and include night sky radiation, evaporative cooling, dessicant cooling, underground building, and induced ventilation. A reference list is provided.

Energy Conservation: Buildings. 1977-October, 1981 (Citations from the NTIS Data Base).
Rept. for 1977-Oct 81.
Dec 81, 377p
Supersedes PB80-812423, and NTIS/PS-79/0556. See also 1964-76, NTIS/PS-79/0502.

Energy conservation in residential, commercial, and industrial buildings through use of efficient heating, air conditioning, and lighting systems is discussed. Topic areas cover the retrofitting of existing buildings, efficient use of electric power, and economics of energy conservation options. A few abstracts deal with general studies on the potential for conserving energy in buildings and guidelines for building owners. Subject areas excluded from this bibliography but available as separate Published Searches are energy conservation through building design, waste heat utilization, total energy systems, and heat pumps. (This updated bibliography contains 369 citations, 64 of which are new entries to the previous edition.)

Federal Land Acquisition and Management Practices.
11 Sep 81, 91p Rept no. GAO/CED-81-135
Report to Senator Ted Stevens.

The National Park Service, Department of the Interior, followed a general practice of acquiring outright ownership of all lands in the National Park System. However, in April 1979, the Service revised its land acquisition policy to give greater consideration to protecting areas through the use of easements, zoning, and cooperative agreements with State and local governments. Although some progress has been made in using alternatives, the Park Service continues to purchase almost all land outright.

PRC Consoer Townsend, Inc., St. Louis, MO.
National Dam Safety Program. A. C. Schneider Lake Dam (MO 31563), Missouri - Kansas City River Basin, Gasconade County, Missouri. Phase I Inspection Report.
Final rept.,
Walter G. Shifrin. Sep 80, 149p
Contract DACW43-80-C-0094
Prepared in cooperation with PRC Engineering Consultants, Inc., Englewood, CO.
Availability: Microfiche copies only.

This dam appears to be in satisfactory condition. However, the dam does not have adequate spillway capacity. Considering the number of inhabited dwellings, a state highway and an oil depot being located downstream of the dam, the PMF is considered the appropriate spillway design flow for A. C. Schneider Lake Dam. The inspection and evaluation indicates that the reservoir/spillway system can accommodate approximately 5 percent of the Probable Maximum Flood without overtopping the dam. It also indicates that the reservoir/spillway system can not accommodate the one-percent chance flood without overtopping, however, the reservoir/spillway system of A. C. Schneider Lake Dam can accommodate the ten-percent chance flood without overtopping. Other deficiencies noted by the inspection team were: the erosion gully along the downstream left abutment/embankment contact, the trees on the downstream and upstream slope of the dam, wave erosion on the upstream slope, the unsupported length of the principal spillway pipe at the outlet, the eroded gulley in the emergency spillway channel, some vegetative growth around the principal spillway inlet, a need for periodic inspection by a qualified engineer and a lack of maintenance schedule. The lack of seepage and stability analyses on record is also a deficiency that should be corrected.

Installation Restoration Program Records Search for Langley Air Force Base, Virginia.
Jun 81, 285p
Contract F08637-80-G-0010
Availability: Microfiche copies only.

The Langley AFB Records Search did not reveal any specific documentation of past hazardous waste disposal at the installation or migration of contaminants off the installation. However, the potential does exist for contaminant migration due to the following factors: (1) The age of the installation and the large number of past disposal sites (11) at the installation; (2) The lack of adequate records concerning the types of materials disposed of at the installation; (3) The high groundwater table conditions at the installation; and (4) The environmentally sensitive location of the installation with respect to Back River, an active shellfish harvesting area. Some limited follow-on field survey work is warranted to ensure that contaminant migration is not a problem at Langley AFB. No indication was found from the records or from the interviews of potential contaminant migration from Cape Charles Air Force Station or Bethel Manor off-base housing.

Mitigation of Shore Damage Attributed to the Federal Navigation Structures at Ludington Harbor, Michigan.
Final environmental statement.
Dec 75, 235p

The Corps of Engineers proposes to mitigate shore erosion in the vicinity of Ludington Harbor, Mason County, Michigan, that is attributable to the Federal navigation structures at the harbor. Studies have determined that the erosion problem is partly attributable to the navigation structures as well as other natural erosion processes. The plan considered most practical for this purpose entails the establishment and maintenance of two beach nourishment supply sites (one north and one south of the harbor structures) to provide immediate and continued relief to damaged shore areas. The unpolluted sediment accululation at or near the harbor mouth will serve as the source of material for the nourishment supply. The establishment and periodic sustenance of these areas will enable those quantities of littoral materials presently interrupted and diverted lakeward by the navigation structures to be restored to the shoredrift system.

Corps of Engineers, Detroit, MI. Detroit District.
Mitigation of Shore Damage Attributed to the Federal Navigation Structures at Port Sanilac Harbor, Michigan.
Final environmental statement.
Sep 75, 176p

The Corps of Engineers proposes to mitigate shore erosion in the vicinity of Port Sanilac Harbor, Sanilac County, Michigan, that is attributable to the Federal navigation structures at the harbor. Studies have determined that erosion attributable to the navigation project is approximately 43.0% of the total erosion due to all causes. The plan considered most practical for this purpose entails creation of a feeder beach and a subsequent periodic nourishment of the area suffering shore damage. Approximately 90,000 cubic yards of fill material will be required initially and 30,000 cubic yards of fill will be required periodically (approximately annually) for an undetermined number of years. The establishment and sustenance of such a beach will provide the quantities of littoral material interrupted by the navigation project to the shore downdrift. (Author)

Maintenance Dredging & Confined Disposal Facility for the Crooked River Portion of Michigan's Inland Route and the Operation, Maintenance, & Proposed Public Use Facilities for the Alanson Lock and Weir, Michigan.
Final environmental statement.
Jan 80, 180p

This statement addresses the Operation and Maintenance of the Crooked River portion of the Inland Route, Michigan, including dredging, dredge material disposal, and the continued operation and maintenance of the Crooker River lock and weir at Alanson, Michigan. Since an upland disposal site would be used, a transfer facility would also be required. Dredged material removed from the Crooked River would be transferred to trucks at the foot of Snider Road at the Crooked River, and hauled to the disposal site, located approximately one (1) mile north on Snider Road. The estimated annual shoaling rate in Crooked River is 1,000 cubic yards, and the river will require about 9,500 cubic yards of backlog dredging. Thus, the total capacity of the site for 10 years is 19,500 cubic yards. Maintenance dredging is necessary to restore the waterway's ability to accommodate recreational craft navigation. The proposed Federal action also includes operation and structural maintenance of the lock and weir on the Crooked River at Alanson. Structural maintenance and operations are required to insure continuance of vessel passage along the Inland Route. Water level regulation of the upstream rivers and lakes is a function of the lock facilities. Additionally included in the action is the proposed construction of public use facilities at the lock. The plan provides for the construction of a parking lot, restroom facilities, storage building, observation platform and docking area, and landscaping. (Author)

AD-A106 935/0 PC **A07**/MF **A01**
Corps of Engineers, Detroit, MI. Detroit District.
Maintenance Dredging of the Federal Navigation Channels in the St. Clair River, Michigan.
Final environmental statement.
Jan 76, 126p

The proposed action is to perform maintenance dredging of the St. Clair River when required to remove shoaling. Average annual volume removed is approximately 130,000 cubic yards consisting primarily of gravel, sand, and silt. The material removed will be disposed of deep water or placed on selected onshore sites. All materials scheduled for removal from the St. Clair River have been classified by the U.S. Environmental Protection Agency as suitable for unrestricted open water disposal. Most maintenance operations are accomplished by hopper dredge, but a derrickboat utilizing a bucket dredge removes channel obstructions if rock rather than sand or silt must be removed. The open water disposal sites used by the hopper dredge are located in the deep water of Lake Huron several miles north of the Blue Water Bridge and during 1976 in deep water of the North Channel adjacent to Point Au Chenes. The use of the North Channel disposal area will be discontinued after the 1976 work season. In subsequent years sediments removed from the lower reaches of the river will be stockpiled at an onshore site furnished by the Michigan Department of Natural Resources for future project was uses in maintenance and further development of the St. Clair Flats Wildlife Area. (Author)

AD-A106 936/8 PC **A09**/MF **A01**
Corps of Engineers, Detroit, MI. Detroit District.
Maintenance Dredging of the Federal Navigation Channels in the Saginaw River and Saginaw Bay, Michigan.
Final environmental statement.
Dec 75, 183p

The proposed project is to perform maintenance dredging of the Saginaw River and Saginaw Bay Federal Navigation channels. Dredging will be performed by a Government-owned hopper dredge. Approximately 140,000 cubic yards of polluted material dredged from the river, from the Detroit and Mackinac Railroad Bridge to the upper limits of the harbor, is placed on the confined disposal area on Middle Ground Island. The polluted channel section from the D&M R.R. bridge to the river mouth and the section throughout the inner bay will not be dredged until a confined disposal site is constructed to contain this dredged material. The average annual volume of shoaling throughout the project is approximately 840,000 cubic yards. (Author)

AD-A106 971/5 PC **A08**/MF **A01**
Corps of Engineers, Detroit, MI. Detroit District.
Final Environmental Statement. Sebewaing River, Michigan. Operation and Maintenance, Confined Disposal Facility, and Flood Control Facilities.
Apr 78, 172p

The proposed Federal action includes maintenance dredging of the Sebewaing River navigation and flood control channel, construction of a confined disposal facility for contaminated dredge material, repair of stop-logs and other structures forming the flood protection project, maintenance of navigation structures protecting the channel, and, as necessary, dynamiting the ice jams to prevent flooding of the Village of Sebewaing. Dredging and disposal activities will have temporary adverse effects on water quality, organisms living in and on the bottom sediments in affected areas, aesthetics, recreational fishing, and the ability of the area to support aquatic life. Beneficial impacts of maintenance dredging include continuance of the existing flood carrying capacity of the river and continuance of the existing local economy through preservation of navigation dependent commercial enterprises. Maintenance of existing flood control facilities may have temporary adverse effects on water clarity, vegetation on levees, and small animals residing in and on the facilities. Beneficial effects include keeping the structures in aesthetically pleasing, functioning condition, thereby reducing the threat of flooding in the Village of Sebewaing.

Investigation of Release Temperatures for Kinzua Dam, Allegheny River, Pennsylvania. Hybrid Model Investigation.
Final rept.,
Mark S. Dortch. Sep 81, 71p Rept no. WES/TR/HL-81-9

Kinzua Dam, which impounds the Allegheny Reservoir, is a multipurpose project that includes pumped-storage hydropower and flood control. Prior to construction of Kinzua Dam, the Allegheny River in its vicinity was considered primarily a warmwater stream and supported an important smallmouth bass sport fishery. Since construction of the dam and power station, stream temperatures below the dam have been colder than expected. A hybrid modeling study was initiated to determine the causes of colder-than-expected releases and to identify and evaluate measures that could be taken to increase the release temperatures. Temperature data were collected and the enlarged data base was used to better understand the physical processes to be simulated in a pumped-storage reservoir thermal simulation numerical model. A physical model, scale 1:100, of the inlet-outlet structure and the surrounding Allegheny Reservoir near-field topography was used to determine the selective withdrawal and pumped-storage mixing characteristics. Mathematical thermal model simulations were used to determine the major factors contributing to the release characteristics. The study determined that the pumped-storage operations have not been the cause of the colder-than-desired releases. Pumped-storage actually causes the hypolimnion to warm faster without significant cooling of the epilimnion. Structural modification of the sluices was determined to be the most effective and practical means of releasing warmer water.

A Statistical Evaluation of Soil and Climatic Parameters Affecting the Change in Pavement Deflection during Thawing of Subgrades,
Edwin J. Chamberlain. Jul 81, 18p Rept no. CRREL-81-15

This report analyzes the results of a field study previously reported by Scrivner et al. (1969) for the National Cooperative Highway Research Program. These authors studied the seasonal pavement deflection characteristics of 24 test sites on roads in service in regions with freezing indexes ranging from 100 F-days to 2100 F-days. They used the Dynaflect cyclic pavement loading device to determine the pavement system response. Of specific interest to my analysis was the increased pavement deflection after freezing and thawing and the time to recovery of normal deflection characteristics. These characteristics were related to soil and climatic factors using statistical techniques. The most significant observations of this statistical analysis are: (1) that the freezing index is not a significant parameter in determining the percent increase in pavement deflection during thawing, and (2) that the recovery time is inversely proportional to the depth of freezing. As was expected, the most significant variable affecting the increase in pavement deflection was the frost susceptibility classification. This observation reinforces the necessity for careful selection of soil materials used in pavement systems. (Author)

Corps of Engineers, Detroit, MI. Detroit District.
Final Environmental Impact Statement on Modifications to Monroe Harbor, Michigan.
Feb 80, 209p

The proposed plan for harbor modification consists of deepening (27-28 feet below Low Water Datum) and widening (500 feet) of the lake channel and lower river channel of the existing project. It also provides for lengthening the existing channel and for the construction of a turning basin in Lake Erie. The dredged material which is unsuitable for open water disposal would be confined in a crescent shaped disposal facility of approximately 190 acres. A wetland would be created behind the disposal facility by raising the lake bottom with clean fill to approximately Low Water Datum. The deep draft channel would allow larger, more economical vessels into the harbor. The confined disposal facility would protect shore areas from wind and wave attack. The rock-faced disposal facility would create a beneficial habitat for aquatic life. The wetland constructed behind the disposal facility would create feeding and spawning areas for fish, provide nesting, feeding and cover for waterfowl, and provide recreational opportunities for fishermen, hunters and sightseers.

Corps of Engineers, St. Paul, MN. St. Paul District.
Ontonagon Harbor Operation and Maintenance Activities. Lake Superior.
Final environmental statement.
Aug 75, 89p

The action involves operation and maintenance of Ontonagon Harbor, Michigan. Principal activities include breakwater repair, dredging, and dredge material disposal. The operation and maintenance of Ontonagon Harbor provides for safe use of the harbor by recre-

ational craft. The use of polluted dredge material in the construction of a waste treatment facility and as fill on biologically sterile lands adjacent to the lagoons, provides advantageous use for the dredge material. The use of non-polluted dredge material as beach nourishment retards the erosion of the shoreline in the area. Adverse effects of the Corps of Engineers operation and maintenance activities in Ontonagon Harbor include increased turbidity and associated biological effects due to dredging, increased noise and congestion in the harbor, and land use alterations due to on-land placement of dredge material.

Recreational Boat Harbor, Cedar River, Michigan. Revisions to General Design Memorandum Number 1 and Environmental Impact Statement. Supplement Number 1.
Final rept.
Aug 80, 279p

A small boat harbor located at the mouth of the Cedar River in the western upper peninsula of Michigan has long been the goal of the Michigan Department of Natural Resources and local entities. Because of the distances between the two existing adjacent harbors of Escanaba, Michigan and Menominee, Michigan, a local harbor of refuge (small boat harbor) would be convenient to area boaters. The present plan of improvement requires construction of an eastern pier, 875 feet in length of rubblemound construction, and rehabilitating the existing western pier with rubblemound construction (navigation lights would be installed on each pier). The construction would allow a recreational small boat harbor to be built by the Michigan Department of Natural Resources upstream of the described construction.

Confined Disposal Facility and Maintenance Dredging of the Les Cheneaux Island Federal Navigation Channels, Michigan.
Final environmental statement.
Jan 79, 173p

The proposed action is the construction of a confined disposal facility for contaminated dredged materials and maintenance dredging of the Les Cheneaux Island channels. The dredged materials disposal facility would be located inland, approximately two miles by road from the new Village of Cedarville Marina. The facility would have a capacity of 110,000 cubic yards. This would contain a ten year maintenance quantity of 40,000 cubic yards, plus 70,000 cubic yards of backlog. In addition, maintenance dredging would include another 18,000 cubic yards of bottom material suitable for open lake disposal. A total of 128,000 cubic yards would be dredged. The channels to be maintained are approximately 40,000 feet in length and have previously been deepened to 7 feet and widened to 100 feet with additional enlargement where required. Maintenance dredging is necessary for continued recreational use of the channels.

CERL-TR-N-111
Contracts CERL-08684-004-10, EPA-78-D-H0234

A project jointly sponsored by the Environmental Protection Agency (EPA), Office of Noise Abatement and Control; the U.S. Army Corps of Engineers, Construction Engineering Research Laboratory (CERL); and the Directorate of Civil Works was undertaken to demonstrate in a construction project the availability of retrofit control technology for pile drivers. Various in-use retrofit noise control measures for reducing the noise of pile drivers were investigated: alternative pile driving techniques, mufflers, noise enclosures, impact cushions, and vibration damping of piles. Costs and productivity impacts associated with the noise control measures were also examined. Costs were developed in units of dollars per pile. Productivity was identified in terms of the time to set up and drive a pile. The ability of a general construction contractor to bid on a noise specification, and then obtain and implement the noise control measures during the construction project were a part of the demonstration. The vibratory pile driver took the longest time to drive a pile. The noise enclosure and muffler had no significant impact on the time to drive a pile. The enclosure did require a longer set up time, but a longer duration test is required to substantiate these productivity data. The Corps of Engineers' use of a detailed contract bid document specifying noise control requirements was successful.

Some Observations on the Economics of 'Overdesigning' Rubble-Mound Structures with Concrete Armor.
Coastal engineering technical aid rept.,
J. Richard Weggel. Jun 81, 14p Rept no. CERC-CETA-81-7

A cost comparison is made between two designs for a revetment-breakwater using concrete armor units. Both designs used the same type of unit (dolosse); however, two different stability coefficients were used in the designs. The comparisons shows that significant decreases in armor unit size may result in only insignificant cost savings and even cost increases for some conditions. This occurs because more smaller units are required to armor a given structure surface area, and any savings in material costs is offset by the increased cost of forming, stripping, and placing a greater number of smaller units. Surface Drainage Design for Airfields and Heliports in Arctic and Subarctic Regions.
Special rept.,
Edward F. Lobacz, and Kenneth S. Eff. Sep 81, 61p Rept no. CRREL-SR-81-22

This report presents engineering guidance and design criteria for drainage facilities at Army and Air Force airfields and heliports in arctic and subarctic regions. Attention is given to hydrologic criteria, icings, environmental impact, storm drains and design computer programs. A design example and a list of 40 references are included in two appendixes. Pothole Primer. A Public Administrator's Guide to Understanding and Managing the Pothole Problem.
Special rept.,
Robert A. Eaton. Sep 81, 30p Rept no. CRREL-SR-81-21

Potholes have become a problem of national proportions. We have seen Congress, in 1978, consider a special $250-million 'pothole bill,' and in 1979 a special Federal-level Task Force was established to study the pothole. This booklet has been prepared for the specific purpose of assisting elected officials and non-engineering administrators of cities, towns, and military facilities in New England in understanding and managing their pothole problems in asphalt pavements. We have attempted to keep this booklet as non-technical as possible so that non-engineers can use it. (Author)

SIMPLEX 'A' - A Simplified Atmospheric Dispersion Model for Airport Use (Users Guide).
Users manual,
Howard M. Segal. Jul 81, 25p Rept no. FAA/EE-81-8

The method, limitations and uses of the SIMPLEX 'A' atmospheric dispersion model are described. The model determines pollutant concentrations from taking-off aircraft and has the flexibility to easily accept parameter changes. It can treat either single or multiple aircraft departures and permits air quality calculations to be made by persons without an extensive computer background. The program is listed and the results of two sample problems are given to illustrate the use of the model. This is a research model with many of its dispersion and turbulence parameters still under investigation. As such it has not been adopted by the FAA for formalized pollution assessments. (Author)

Structural Stability Evaluation, Winnibigoshish Dam.
Final rept.,
Carl E. Pace. Sep 81, 73p Rept no. WES/MP/SL-81-27
Contract NCS-1A-78-75

A typical interior monolith of Winnibigoshish Dam was evaluated for adequacy in stability for five load cases: Normal operation; Normal operation with truck loading (H15-44); Normal operation with earthquake; Normal operation with ice; and High-water condition. By using the conventional stability analysis (rigid body assumptions), the approximate magnitude of loads which are on the foundation piles were determined; but, without knowing the supporting characteristics of the foundation material, an estimation of the adequacy of the structural stability was inconclusive. The supporting characteristics of the foundation material were determined by in situ testing using a pressuremeter to predict the horizontal supporting characteristics of the pile-soil system. Two NX core holes were drilled through typical monoliths to obtain access to the foundation material. One other hole was drilled to sample the supporting decking, beams, and piling. the pressuremeter tests were performed and in situ soils data obtained. The horizontal soil modulus was obtained as a variation with depth into the foundation material and with soil deformation for three test positions in each of the two test holes. The horizontal modulus of subgrade reaction was then used in a three-dimensional direct stiffness analysis to determine the forces and deflections of the foundation piles. A beam on an elastic foundation analysis was performed and the pressure, moment, and deflection along the length of the most critically loaded pile were determined.

National Dam Safety Program. Crancer Lake Dam (MO 10764), Missouri - Kansas City Basin, Warren County, Missouri. Phase I Inspection Report.
Final rept.,
Harold B. Lockett, and Albert B. Becker, Jr. Sep 80, 56p
Contract DACW43-80-C-0063

Crancer Lake Dam was visually inspected by engineering personnel. The purpose of this inspection was to assess the general condition of the dam with respect to safety and, based upon this inspection and available data, determine if the dam poses a hazard to human life or property. The following report summarizes the findings of the visual inspection and the results of certain hydrologic/hydraulic investigations performed under the direction of the inspection team. Based on the visual inspection and the results of these hydrologic/hydraulic investigations, the present general condition of the dam is considered to be satisfactory. However, certain deficiencies were noticed during the inspection and are considered to have an adverse effect on the overall safety and future operation of the dam.

Maintenance Operations of the Federal Navigation Channels and Structures at Bolles Harbor, Michigan.
Final environmental statement.
Feb 78, 83p

Dredging and disposal activities would have temporary adverse effects on water quality, organisms living in and on the bottom sediments in affected areas, aesthetics, recreational fishing, and the ability of the area to support aquatic life. Beneficial impacts of maintenance operations include continuance of the existing local economy through preservation of navigation-dependent commercial enterprises and through recreational benefits available to regional residents and tourists. Water quality may be temporarily impacted by several of the proposed activities. The impacts would essentially be limited to turbidity and the possible release of nitrogen compounds to the waters during dredging and disposal operations. Recreationalists may be temporarily inconvenienced. In addition to maintenance dredging by bucket or hydraulic pipeline dredge, other alternatives include: (1) discontinue maintenance dredging; (2) dredge the harbor to a lesser depth; (3) alternative dredge types; and (4) dredge only the critically shoaled areas. Implementation of the alternatives could cause economic or social impacts in the Bolles Harbor area. Alternatives to the proposed disposal methods are enumerated. The only true alternative to maintenance of structures related to the navigation project is to terminate maintenance.

AD-A107 369/1 PC **A12**/MF **A01**
Corps of Engineers, Detroit, MI. Detroit District.
Confined Disposal Facility at Pointe Mouillee for Detroit and Rouge Rivers.
Final environmental statement.
Mar 74, 268p

Containment of the polluted dredge spoil will remove it as a source of pollution to the open waters of the bay. Dikes will protect Pointe Mouillee Wildlife shoreland marshes from further erosion and create additional fishing habitat. Future development and management of the site and marshlands will optimize wildlife habitats and provide recreational potential for waterfowlers and naturalists. Replacement of 700 acres of Lake Erie bottomland by the proposed structure may introduce an adverse esthetic impact on the natural landforms of the area. The dikes and management measures would create a secondary adverse impact on historical and biological relationships of the marsh to the lake. Although the structure will offer a protection against erosion from wave action, it will not prevent losses of vegetation from flooding. The function of the marsh as a spawning and feeding habitat for fish, as it existed in the 1930's, is now measurably reduced and would not resume behind the anticipated dikes. A lagoon situation behind the dikes, which would enhance conditions relative to spawning and feeding, is dependent on levels of turbidity and concentrations of pollutants that may result. Alternatives to the recommend plan include: (1) Resume open lake disposal which would return pollutants to the waterways, but such action is prohibited by request of the Governor of Michigan; (2) Discontinue dredging of polluted sediments which would reduce channel depths and curtail shipping; and (3) Use another site for disposal.

AD-A107 370/9 PC **A08**/MF **A01**
Corps of Engineers, Detroit, MI. Detroit District.
Maintenance Dredging of the Federal Navigation Channels in the Detroit River, Michigan.
Final environmental statement.
Jan 76, 163p

Resumption of the removal of polluted material will temporarily degrade the water quality and localized turbid problems are anticipated to be encountered at areas during removal of the rocky material. Disposal of the dredged material into their respective disposal sites may affect the aquatic ecosystem. Continued economic and social stability of the Great Lakes is dependent upon commercial navigation which requires maintenance dredging of the connecting channels of the Detroit River. Short-term increased turbidity and temporary water quality degradation in the area of operation are effects of maintenance dredging. Aquatic life in the dredging areas will be disturbed or destroyed. Disposal of the dredged sediments will alter existing habitats and may otherwise adversely affect organisms at the disposal areas. Dredging alternatives include: (1) alternative dredge types; (2) discontinue maintenance dredging completely; (3) dredge the connecting channels to a lesser depth; and (4) wastewater management. Implementation of the alternatives will cause economic or social impacts on the Detroit River area as well as the Great Lakes region. Alternatives to the disposal methods are examined. In terms of economic and engineering feasibility, irretrievable resources and minimal ecological disruption, the process of confined disposal of polluted materials and open water disposal for non-polluted sediments offers the best alternatives at present.

Original cotnains color plates: All DTIC and NTIS reproductions will be in black and white.

This report was prepared under the National Program of Inspection of NOn-Federal Dams. This report assesses the general condition of the dam with respect to safety, based on available data and on visual inspection, to determine if the dam poses hazards to human life or property. This dam has been classified as unsafe, non-emergency by the St. Louis District as a result of the application of the following criteria: (1) Spillway will not pass 50 percent of the Probable Maximum Flood without overtopping the dam; (2) Overtopping of the dam could result in failure of the dam; and (3) Dam failure significantly increases the hazard to loss of life downstream.

National Dam Safety Program. Greenhaven Correction Facility Dam (Inventory Number N.Y. 11700), Lower Hudson River Basin, Duchess County, New York. Phase I Inspection Report,
Eugene O'Brien. 9 Sep 81, 94p
Contract DACW51-81-C-0008

This report provides information and analysis on the physical condition of the dam as the report date. Information and analysis are based on visual inspection of the dam by the performing organization. Examination of the available documents and visual inspection of the Greenhaven Correction Facility Dam did not reveal conditions which constitute a hazard to human life or property. Using the Corps of Engineers screening criteria for review of spillway adequacy, it has been determined that the concrete gravity dam would be overtopped for all storms exceeding approximately 38.8 percent of the Probable Maximum Flood (PMF). Although the spillway capacity is inadequate from a hydraulic and hydrologic point of view, the hydraulic inadequacy will not affect the stability of the concrete dam section during overtopping nor the safety of the dam since it is supported on sound rock and overtopping will cause neither significant erosion at the toe or abutment nor undermine the foundation. In addition the dam stability is considered to be adequate against overturning and sliding. (Author)

Tippetts-Abbett-McCarthy-Stratton, New York.
National Dam Safety Program. Paterno Dam (Inventory Number N.Y. 101), Long Island Basin, Westchester County, New York. Phase I Inspection Report,
Eugene O'Brien. 13 Aug 81, 49p
Contract DACW51-81-C-0008

This report provides information and analysis on the physical condition of the dam as of the report date. Information and analysis are based on visual inspection of the dam by the performing organizations. Phase I investigation of Paterno Dam did not indicate conditions which constitute an immediate hazard to human life or property. Based on engineering judgment and the performance of the dam, the project appears to be fair condition. The project, however, does have inadequacies which if not remedied, have the potential for developing into hazardous conditions. Using the Corps of Engineers Screening Criteria for review of spillway adequacy, it has been determine that the spillway is adequate for half (1/2) PMF and PMF. The spillway is therefore judged to be adequate. (Author)

National Dam Safety Program. White Plains Reservoir Dam Number 2 (Inventory Number N.Y. 24), Long Island Basin, Westchester County, New York. Phase I Inspection Report,
Eugene O'Brien. 5 Aug 81, 91p
Contract DACW51-81-C-0008
Availability: Microfiche copies only.

Examination of available documents and a visual inspection of the dam and the appurtenant structures did not reveal conditions which constitute an immediate hazard to human life or property. The classification of 'unsafe' applied to a dam because of a 'seriously inadequate spillway' is not meant to connote the same degree of emergency as would be associated with an 'unsafe' classification applied for a structural deficiency. It does mean, however, that based on an initial screening, and preliminary computations, there appears to be a serious deficiency in spillway capacity so that if a severe storm were to occur, overtopping and failure of the dam would take place, significantly increasing the hazard to loss of life downstream from the dam.

National Dam Safety Program. Norwich Water Works Dam Number 1 (Inventory Number NY 347), Susquehanna River Basin, Chenango County, New York. Phase I Inspection Report,
Hugh C. Flaherty. 4 Aug 81, 252p
Contract DACW51-81-C-0006
Availability: Microfiche copies only.

This report provides information and analysis on the physical condition of the dam as of the report date. Information and analysis are based on visual inspection of the dam by the performing organization. Examination of available documents and a visual inspection of the dam did not reveal conditions which constitute an immediate hazard to human life or property. However, the dam has some deficiencies that need to be evaluated and remedied. Using the Corps of Engineers' screening criteria for the initial review of spillway adequacy, it has been determined that the embankment would be overtopped by the outflow resulting from all storms exceeding 17 percent of the Probable Maximum Flood (PMF) when the flashboards are in place and the overtopping discharge from the embankment portion of Norwich Reservoir No. 2 Dam (NY 349) is included as an inflow hydrograph. Dam overtopping, the resulting erosion of the embankment and hence, dam breaching would cause water surface levels downstream to reach depths which would pose significant danger to residents. Therefore, the spillway is adjudged to be seriously inadequate and the dam is assessed as unsafe, nonemergency.

Contract DACW65-81-D-0020
Prepared in cooperation with Timmons (J.K.) and Associates, Inc.
Availability: Microfiche copies only.

The purpose of a Phase I inspection is to identify expeditiously those dams which may pose hazards to human life or property. The assessment of the general conditions of the dam is based upon available data and visual inspection. Based upon the field conditions at the time of the field inspection and all available engineering data, the Phase I report addresses the hydraulic, hydrologic, geologic, geotechnic, and structural aspects of the dam. Phase I reports include project information of the dam appurtenances, all existing engineering data, operational procedures, hydraulic/hydrologic data of the watershed, dam stability, visual inspection report and on assessment including required remedial measures. The spillways will pass 30 percent of the Probable Maximum Flood (PMF) or 60 percent of the SDF without overtopping the dam. During the SDF, the dam will be overtopped for a period of 5.5 hours up to a maximum of 1.8 feet and reach a maximum velocity of 5.9 fps. Flows overtopping the dam during the SDF are not considered detrimental to the embankment with respect to erosion. The spillway is judged inadequate, but not seriously inadequate. The visual inspection did not reveal any problems which would require immediate attention. A summary of the design stability analyses for the upstream slope under drawdown conditions and the downstream slope under steady seepage conditions were reviewed and found to be acceptable.

National Dam Safety Program. Byram Lake Reservoir Dam (Inventory Number N.Y. 1175), Long Island Basin, Westchester County, New York. Phase I Inspection Report,
Eugene O'Brien. 13 Aug 81, 143p
Contract DACW51-81-C-0008
Availability: Microfiche copies only.

This report provides information and analysis on the physical condition of the dam as of the report date. Information and analysis are based on visual inspection of the dam by the performing organization. The examination of documents and the visual inspection findings of Byram Lake Dam did not reveal conditions which constitute an immediate hazard to life and property. However, the dam has some deficiencies which require further investigation and remedial action. Using the Corps of Engineers screening criteria for initial review of the spillway adequacy, it has been determined that the dam would be overtopped by all floods exceeding 61 percent of the PMF. The maximum spillway discharge capacity is 18.4 percent of the peak PMF outflow. The spillway is therefore judged to be inadequate. The structural stability analysis based on available information, assumed strength parameters and material properties and visual inspection indicates that the dam is inadequate in overturning and sliding for all loading conditions except for the normal loading. (Author)

National Dam Safety Program. Lake Carmel Dam (Inventory Number N.Y. 100), Lower Hudson River Basin, Putnam County, New York. Phase I Inspection Report,
Eugene O'Brien. 13 Aug 81, 122p
Contract DACW51-81-C-0008
Availability: Microfiche copies only.

This report provides information and analysis on the physical condition of the dam as the report date. Information and analysis are based on visual inspection of the dam by the performing organization. The examination of documents and the visual inspection findings of the dam and its appurtenant structures did not reveal conditions which constitute an immediate hazard to human life and property. However, the dam has some deficiencies which require further investigations and remedial action. Using the Corps of Engineers' screening criteria for initial review of the adequacy of the service spillway, it has been determined that the structure is inadequate for all floods in excess of 17.5 percent of the Probable Maximum Flood (PMF). Overtopping of the dam could cause breaching the embankment section of the dam: this would significantly increase the

hazard of loss of life and property. The spillway section is therefore judged to be 'seriously inadequate' and the dam is assessed as unsafe, non-emergency. Based on an initial screening and the service spillway capacity, such that if a severe storm were to occur, overtopping would significantly increase the hazard to life downstream of the dam.

National Dam Safety Program. Sparkle Lake Dam (Inventory Number N.Y. 1330), Lower Hudson River Basin, Westchester County, New York. Phase I Inspection Report,
Eugene O'Brien. 14 Aug 81, 77p
Contract DACW51-81-C-0008
Availability: Microfiche copies only.

This report provides information and analysis on the physical condition of the dam as of the report date. Information and analysis are based on visual inspection of the dam by the performing organization. The examination of documents and visual inspection of Sparkle Lake Dam and appurtenant structures did not reveal conditions which constitute an immediate hazard to human life or property. However, the dam has some deficiencies which require further investigation and remedial action. Using Corps of Engineers screening criteria for initial review of spillway adequacy, it has been determined that the dam would be overtopped for all storms exceeding 48 percent of Probable Maximum Flood (PMF). The overtopping of the dam could cause the erosion of both abutments and the downstream face of the dam resulting in dam failure, thus significantly increasing the hazard to life and property downstream. The pipe spillway is, therefore adjudged as seriously inadequate and the dam is assessed as unsafe, non-emergency.

Control of Air Pollution from Aviation: The Emission Standard Setting Process.
Doctoral thesis,
Dennis Freeman Naugle. 1981, 260p Rept no. AFIT-CI-81-26D

Air pollutant emissions from aviation sources are a small but increasing part of all emissions on a national scale. The United States Environmental Protection Agency first issued emission standards for aircraft engines in 1973 and has repeatedly changed the control regulations since that time. Critics claim the standards are too stringent and do not solve any real air pollution problems. Proponents argue that ambient air standards for oxidants and other pollutants are frequently violated and will not be achieved unless control technology is applied to many sources - including those the size of airports. The objective of this research is to evaluate the potential effects of aviation on ambient air quality with special emphasis on the requirement and techniques for setting aviation control standards. A logical framework called the 'hypothesis decision model' was developed. It offers a structured way of dealing with complex issues. Application of the model focuses on aircraft sources but a generic version is also proposed. Adoption would explicitly document the manner that technical evidence is considered in a variety of decisions concerning the establishment of emission standards.

National Dam Safety Program. Burton-Duenke Dam Number 5 (MO 31608), Missouri - Osage - Gasconade Basin, Camden County, Missouri. Phase I Inspection Report.
Final rept.,
Edwin R. Burton, and Harry L. Callahan. Apr 81, 66p
Contract DACW43-81-C-0037
Availability: Microfiche copies only.

The dam is an earth structure approximately 450 feet long along the crest and 43 feet high. The dam crest is 49 feet wide. The spillway is an uncontrolled 18-inch corrugated metal pipe installed in the embankment. There is no emergency spillway. Well water is pumped into the lake through a valved 2-inch plastic pipe. Our inspection and evaluation indicates the spillway does not meet the criteria set forth in the guidelines for a dam having the above size and hazard potential. The spillway will not pass the probable maximum flood without overtopping but will pass 15 percent of the probable maximum flood. Based on visual observations, this dam appears to be in satisfactory condition. Deficiencies visually observed by the inspection team were seepage on the downstream slope, at the toe, and on both abutments, erosion on the upstream and downstream slopes and at the interface of the right abutment and the upstream slope, small trees on the upstream and downstream slopes, the very thin ground cover and poor drainage on the crest.

National Dam Safety Program. Kehr's Mill Trail Upper Dam (MO 11636), Missouri - Kansas City Basin, St. Louis County, Missouri. Phase I Inspection Report.
Final rept.,
Edwin R. Burton, and Harry L. Callahan. Nov 80, 99p
Contract DACW43-80-C-0074
Availability: document partially illegible.

The dam is an earth structure approximately 450 feet long along the curved alignment of the crest and is 30 feet high. The dam crest is 47 feet wide. The spillway consists of twin 36-inch corrugated metal pipes with beveled ends installed through the embankment. The beveled inlet and outlet ends of the pipes are encased in unformed poured concrete. Flow through the pipes will discharge onto a 12-foot wide concrete chute to the lower lake. There is no emergency spillway for this dam. Our inspection and evaluation indicates that the spillway does not meet the criteria set forth in the guidelines for a dam having the above size and hazard potential. The spillway will not pass the probable maximum flood without overtopping the dam but will pass 10 percent of the probable maximum flood. Based on visual observations, this dam appears to be in satisfactory condition. Deficiencies visually observed by the inspection team were erosion of the upstream face, crest, and downstream toe, trees on the downstream face, undercutting and cracking of the concrete spillway chute, and poor vegetal cover on the embankment.

National Dam Safety Program. Black Tailings Dam (MO 31154), Mississippi - Kaskaskia - St. Louis Basin, Washington County, Missouri. Phase I Inspection Report.
Final rept.,
Kenneth B. King, James H. Gray, and Donald E. Westcott. Aug 79, 77p
Contract DACW43-79-C-0037

This report presents the results of field inspection and evaluation of the Black Tailings Dam. This dam has been classified as unsafe, emergency by the St. Louis District as a result of the application of the following criteria: (1) This dam which has no spillway will not contain a 10-year frequency flood without overtopping occurring. The storage capacity of this dam is, therefore, considered to be unusually small and seriously inadequate; (2) Overtopping could result in dam failure; and (3) Dam failure would significantly increase the hazard to life and property downstream.

Black and Veatch, Kansas City, MO.
National Dam Safety Program. No Name 165 (Crystal Lake Dam) (MO 10580), Missouri - Kansas City Basin, Jackson County, Missouri. Phase I Inspection Report.
Final rept.,
Paul R. Zaman, Bruce A. Ainsworth, and Harry L. Callahan. Jul 78, 42p
Contract DACW43-78-C-0148

Crystal Lake Dam was inspected by a team of engineers. The purpose of the inspection was to make an assessment of the general condition of the dam with respect to safety, based upon available data and visual inspection, in order to determine if the dam poses hazards to human life or property. Our inspection and evaluation indicates the spillway does meet the criteria set forth in the guidelines for a dam having the above size and hazard potential. The spillway will pass the probable maximum flood without overtopping. It should be noted that a flood of this magnitude would inundate major portions of Excelsior Springs, Missouri as indicated in the Flood Insurance Study for Excelsior Springs, Missouri, U.S. Department of Housing and Urban Development, Federal Insurance Administration.

Environmental Impacts Associated with Using Peat for Energy.
R. M. Reed, L. D. Voorhees, and P. J. Mulholland.
1981, 12p CONF-810909-8
Contract W-7405-ENG-26
International gas research conference, Los Angeles, CA, USA, 28 Sep 1981.

Peat is an attractive energy alternative in the north-central states and on the southeastern coastal plain because: (a) it provides an indigenous supply of energy; (b) it is found in surface deposits and therefore can be easily mined; (c) the technologies to convert peat to useable energy are either proven or appear to be feasible; and (d) attractive possibilities exist for converting mined peatlands to productive agricultural or silvicultural use. The major environmental constraints associated with development of peatlands are related to disruption of important regional wetland ecosystems in terms of (a) ground and surface water hydrology; (b) water and air quality; (c) critical habitat for species of limited distribution; and (d) unique ecosystems that have important scientific and educational values. Development of peat resources for energy can be accomplished in an environmentally acceptable manner but will require detailed environmental planning and evaluation of these important regional ecosystems. Potential Uses of Spent Shale in the Treatment of Oil Shale Retort Waters.
J. P. Fox, D. E. Jackson, and R. H. Sakaji. Jun 80, 12p CONF-800425-6
Contract W-7405-ENG-48
13. oil shale symposium, Golden, CO, USA, 16 Apr 1980.

This paper evaluates two potential uses of spent shale for the treatment of in-situ oil shale process waters - in-situ treatment in an abandoned retort and surface treatment by columns of spent shale. Batch and column studies were conducted using four in-situ retort waters, one gas condensate, and six spent shales. The effect of spent shale contact on the organic and inorganic carbon, conductivity, and pH of the waters was determined and related to specific surface area of the shale and retort operating conditions. These studies indicate that spent shale may be used to reduce the organic and inorganic carbon, conductivity, color, and odor and to elevate the pH of retort waters and gas condensate. Spent shale reduces the inorganic carbon by 47 to 98%, the organic carbon by 7 to 66%, and elevates the pH from initial levels of 8 to 9 up to 10 to 11. TOSCO II spent shale was the best adsorbent for organic carbon, while Lurgi and simulated in-situ spent shales achieved the highest inorganic carbon reduction. These results suggest that a packed bed of spent shale could be placed ahead of an ammonia removal step in a retort water treatment system. The increase in pH achieved by the spent shale column would convert ammonium to ammonia which could be readily stripped. The simultaneous reduction in electrical conductivity and dissolved organic and inorganic carbon by the spent shale column would decrease the load of these constituents on subsequent treatment steps. Coal Desulfurization by Low Temperature Chlorinolysis, Phase 3.
Technical Report, 1 Mar. 1980 - 1 Mar. 1981.
J. Kalvinskas, N. Rohatgi, and J. Ernest. 1 Mar 81, 170p NASA-CR-164957, JPL-PUB-81-82
Contract DE-AI01-77ET-12547
Sponsored by NASA.

Laboratory scale, bench scale batch reactor, and mini-pilot plant tests were conducted on 22 bituminous, subbituminous, and lignite coals. Chemical pretreatment and post treatment of coals relative to the chlorination were tried as a means of enhancing desulfurization by the chlorinolysis process. Elevated temperature (500-700 C) hydrogen treatment of chlorinolysis-processed coal at atmospheric pressure was found to substantially increase coal desulfurization up to 90 percent. Sulfur forms, proximate and ultimate analyses of the processed coal are included. Minipilot plant operation indicates that the continuous flow reactor provides coal desulfurization results comparable to those obtained in the batch reactor. Seven runs were conducted at coal feed rates of 1.5 to 8.8 kg per hour using water and methylchloroform solvents, gaseous chlorine feed of 3 to 31.4 SCFH at 21 to 70 C, and atmospheric pressure for retention times of 20 to 120 minutes.

Comparative Cost Estimates of Five Coal Utilization Processes.
Jan 79, 256p
Contract W-7405-ENG-26

Detailed capital and operating cost estimates were prepared for the generation of electric power in a new, net 500 MW (e), coal-burning facility by five alternative processes: conventional boiler with no control of SO sub 2 emissions, atmospheric fluidized bed steam generator (AFB), conventional boiler equipped with a limestone FGD system, conventional boiler equipped with magnesia FGD system, and coal beneficiation followed by a conventional boiler quipped with limestone FGD for part of the flue gas stream. For a coal containing 3.5% sulfur, meeting SO sub 2 emission limits of 1.2 pounds per million Btu fired was most economical with the limestone FGD system. This result was unchanged for a coal containing 5% sulfur; however, for 2% sulfur, limestone FGD and AFB were competitive methods of controlling SO sub 2 emissions. Brief consideration of 90% reduction of SO sub 2 emissions led to the choice of limestone FGD as the most economical method. Byproduct credit for the sulfuric acid produced in regenerating the magnesia could make that system competitive with the limestone FGD system, depending upon local markets. The cost of sludge fixation and disposal would make limestone FGD noneconomic in many situations, if these steps are necessary. (ERA citation 04:049853)

Tallahassee-Leon County Wastewater Management, Tallahassee, Leon County, Florida.
Draft Environmental Impact Statement.
Sep 81, 213p Rept no. EPA-904/9-81-082

This Draft EIS has been prepared in response to issues raised in opposition to portions of the Tallahassee-Leon County 201 Facilities Plan. The EIS addresses wastewater management needs for growth areas which will not be served by 201 facilities already approved by EPA. Alternatives for wastewater management in the study area were developed and evaluated with emphasis on protection of the groundwater resources and sensitive natural systems such as floodplains and wetlands. The Draft EIS preferred alternative includes the expansion of the existing system until the approved facilities have been constructed. New growth in wastewater generation will be handled by on-site systems, small community systems, and by tying into the existing system.

New England River Basins Commission, Boston, MA.
Saco and Southern Maine Coastal River Basins Overview.
27 Oct 80, 177p
Sponsored in part by Water Resources Council, Washington, DC.

The Saco and Southern Maine Coastal River basins drain 1,698 square miles in southern Maine and New Hampshire. The coastal belt, with its rapid population growth and heavy recreational use, experiences water related problems with insufficient public water supplies, flood hazards on the coastal flood plain, and water pollution. In the less developed northern basin, management is needed to protect the flood plain, to prevent problems associated with recreational overuse of the Savo River, and to meet increasing demands for forest harvesting. The report recommends coordination of several proposed planning efforts, particularly the USDA Cooperative River Basin Study. This Overview, one of a series of 14 such reports, assesses issues related to eight water resource demands and recommends next steps in planning and management.

Treatability Studies of Pesticide Manufacturing Wastewaters: Ethylenebisdithiocarbamate Fungicides.
Final rept. Jan-Mar 80,
Ruth A. Zweidinger, Rosemary Batten, R. Wayne Hendren, Linda W. Little, and Dora Liverman. Dec 80, 83p EPA-600/2-80-077E, IERL-RTP-1254
EPA-68-02-2688
See also report for Feb 78-Mar 80, PB81-159097.

The report gives results of laboratory and pilot studies on the biological treatability of wastewaters from the manufacture of ethylenebisdithiocarbamate (EBDC) fungicide. At concentration levels representative of EBDC production units and total plant wastewaters discharged to publicly owned treatment works (POTWs) (1 mg/L), results indicate little reduction in EBDC levels or in ethylene thiourea (ETU), an important decomposition product of EBDC as a result of biological treatment. Results of algal (Selenastrum capricornutum) and fish (Daphnia magna) bioassays on the treated wastewater indicated inhibition of algal growth and fish mobility, although little toxicity was indicated. Chemical oxygen demand (COD) removal by the biological (activated sludge) treatment unit was unaffected by the fungicide wastewater, although nitrification was reduced or absent in these units.

Tethered Balloon Sampling Systems for Monitoring Air Pollution.
Journal article,
James A. Armstrong, Phillip A. Russell, Leslie E. Sparks, and Dennis C. Drehmel. 1981, 12p EPA-600/J-81-383
Grant EPA-R-804829
Pub. in Jnl. of the Air Pollution Control Association, v31 n7 p735-743 Jul 81.

The paper is an overview of recent studies in which balloons, usually tethered, have been used to investigate the structure and air quality of the planetary boundary layer. It also describes a number of lightweight tethered balloon sampling systems, developed to investigate particulate and gaseous emissions from point and nonpoint sources. The sampling systems have both vertical and horizontal mobility and sample at specified altitudes for extended periods of time. Two of the balloon-borne samplers are remote controlled and have been used to monitor emissions in the plumes of point sources. A third sampler has been developed to investigate the vertical extent and downwind transport of particle emissions from fugitive sources. A fourth sampler, currently being developed, is also described.

Nitrosamines and Other Hazardous Emissions from Engine Crankcases.
Technical rept.,
Thomas M. Baines. Jun 81, 15p EPA/AA/CTAB/PA/81-15

The emissions from heavy duty Diesel crankcases contain a number of hazardous compounds. Research has discovered some of them and it may be possible that there are some that have not yet been quantified. Nitrosamines (a potent carcinogen in animals and probably also in humans) are emitted from engines using fresh oil. These emissions seem to be a function of the type of oil used and some engine parameters such as crankcase flow rate of NOx compounds. Used lubricating oil has been shown to contain carcinogenic compounds such as benzo-a-pyrene. It has also been shown to be mutagenic. Therefore it can be concluded that the particulate portion of the crankcase effluent stream may start out after an oil change at a level containing few carcinogenic compounds but the level of these compounds increases with time. In conclusion, crankcases emit a variety of hazardous chemicals and evaluation of the costs and benefits of the control of these emissions should be seriously considered.

Evergreen Point Bridge Maintenance Problems, 1980.
Final research rept. 1975-80,
C. B. Brown. Sep 80, 45p WA-RD-44.1
Prepared in cooperation with Federal Highway Administration, Washington, DC.

The 1974-79 study of the maintenance problems of the drawspan mechanism of the Evergreen Point Bridge across Lake Washington is reported. The approach was to predict the life of elements by Miner's hypothesis. For this the strains at critical points and the wind vector were measured over two sessions. These results were correlated with long term wind data to provide the number of cycles in a year at various stress levels. The fatigue capacity of anchor rods was determined by the Prot test on six specimens. The resulting

S-N curve was compared to the field measurements to determine the expected life of the rods from the Miner criterion. The methods developed provide useable maintenance procedures for the prevention of fatigue failure of critical structural elements.

Sep 81, 38p TVA/OECD/CD-81/23

This study pertains to flooding along Big Creek, the only stream having an identified flood hazard potential, which presents a major threat to life and property within the city limits. The information and technical data contained herein provide the basis for the development of revised flood damage prevention regulations and for future considerations of other floodplain management measures.

Methods for Allocating Highway Costs.
Staff study (Final),
Douglass B. Lee. Apr 81, 86p SS-24-U3-181, FHWA/PL-81/017

Microeconomic theory and other concepts related to pricing are reviewed and applied to the problem of designing highway user charges. In view of the emphasis in the Congressional request for the Highway Cost Allocation Study on setting charges in accordance with costs occasioned, economic efficiency should be a major study goal. The goal of equity, whichever of its many meanings that term may have, remains an important consideration but not one which provides direct guidance for user charges. In regard to highway transportation, efficiency and equity do not appear to conflict in any significant ways. Efficient user charges are based on variable costs, primarily pavement damage, vehicle interference, and negative external costs.

Florida Game and Fresh Water Fish Commission, Vero Beach.
An Assessment of Wetland Habitat Establishment at a Central Florida Phosphate Mine Site.
Final rept.,
Terry Gilbert, Tim King, and Brian Barnett. Sep 81, 112p FWS/OBS-81/45
Contract DI-14-16-0004-78-907
Prepared in cooperation with International Minerals and Chemical Corp., Bartow, FL.

Intensive strip mining operations used to recover the phosphate ore have had a significant effect on the ecology of central Florida. Approximately 6,500 acres of land are mined each year resulting in the total onsite disruption of existing soils, topography, drainage features, plant communities, and wildlife populations. Of the various habitats lost to mining, none are more critically important to wildlife than wetlands. This study investigated methods of establishing suitable habitat for wetland wildlife on phosphate mined lands.

Contract DI-14-16-0009-78-060
See also Volume 2, PB82-130824.

Part 1 of this 2-volume manual provides general information on the extent and nature of surface mining in the East, the amount of reclamation that has been accomplished, postmining land use alternatives, and environmental effects of surface mining in the past. The report covers much of the information available on fish and wildlife responses to habitat alterations caused by mining and reclamation. Information is presented concerning the capabilities to support fish and wildlife of mine spoils and land forms resulting from mining.

See also Volume 1, PB82-130816.

Volume II of this two-volume reference manual is intended primarily for use by reclamation planners and managers as a general reference document. It identifies some of the opportunities for fish and wildlife planning and management in connection with various methods of surface mining for coal and the reclamation and management of surface-mined lands. It suggests approaches for management to enhance fish and wildlife in differenct regions and under different conditions, using real-life or hypothetical case examples. It further illustrates what productive habitat for various kinds of wild animal communities looks like at different stages of development.

Regional Pipeline Environmental Assessment Record: An Aggregate Analysis of Major Areas of Pipeline Concern and Impact on the Outer Continental Shelf (Gulf of Mexico).
Mar 81, 298p BLM-YM-P/T-81-012-1792

Oil and gas pipeline activities on the Gulf of Mexico Outer Continental Shelf (OCS) affect a wide range of living and nonliving environmental variables (i.e., water, biologically sensitive areas, and food-web relations). These industrial activities have been increasing steadily over the past 20 years. Much of the information included herein pertains to a description of the existing environment for offshore Louisiana and Texas and an analysis of potential pipeline proposals and alternatives. The document is not as complete as an environmental impact statement (EIS) but it is sufficient in scope to consider the analysis of impacts of the majority of pipeline activities occurring in the northern and western Gulf of Mexico OCS. This report will be useful in evaluating pipeline impacts on the regional environment in the future. Rather than treating each pipeline application extensively, the information included herein will be referenced, thereby reducing the paperwork involved in environmental analysis.

Simulated Interactions between the Proposed Narrows Reservoir and the Water-Table Aquifer Along the South Platte River, Morgan County, Colorado.
Water-resources investigations (Final),
Alan W. Burns. 1981, 68p USGS/WRD/WRI-81-095, USGS/WRI-80-119
Prepared in cooperation with Water and Power Resources Service, Lower Missouri Region.

A computer model, including a ground-water-flow component and a mass-balance reservoir-operations component, was developed to simulate the proposed Narrows Reservoir and the adjacent alluvial aquifer of the South Platte River, Morgan County, Colorado. This model, using a weekly time step, simulated the transient interactions of these two systems for an initial-fill condition, a general-operational condition, and a sensitivity analysis to test the effects of possible data-input errors. The initial-fill simulation indicated that to fill the reservoir when hydraulic connection between the surface-water system and the aquifer is simulated would take 2 additional years if no connection were assumed. Parameters tested for sensitivity, in order of decreasing sensitivity, were: Transmissivity, specific yield, hydraulic connection between reservoir and aquifer, local recharge, boundary conditions, and dam permeability.

Wave Forces on Causeway-Type Coastal Bridges: Effects of Angle of Wave Incidence and Cross-Section Shape.
Final rept. 1 Oct 78-30 Sep 80,
Keith H. Denson. Dec 80, 256p MSHD-RD-80-070, FHWA/MS-80/070
Prepared in cooperation with Mississippi State Univ., Mississippi State.

Wave forces and moments were obtained for two different coastal bridge types as functions of wave height, water depth and angle of water incidence. 1:24 scale models of both bridges were used to determine forces and moments. One bridge model was a slab and beam type carrying four lanes of traffic along two structurally separated pairs of bridges adjacent to one another and with a common pile bent foundation. This

model was of the Bay St. Louis, Mississippi bridge on U.S. Highway 90 which was heavily damaged by Hurricane Camille in 1969. The other bridge model was a trapezoidal box girder with 1:10 superelevation to seaward. Results are presented in the form of dimensionless design graphs which are suitable for use on any other geometrically similar bridges.

Traffic Diversion Software Applications Summary.
Final rept.,
R. A. Reiss. Sep 81, 61p GF-3708-1067, FHWA/RD-80/100
Contract DOT-FH-11-9557

The report summarizes potential applications for a software package which optimizes traffic flow in a roadway corridor. Two versions of the package are described. The on-line version (DIVERT) contains an algorithm which optimizes a performance objective in the corridor. This version is intended for integration into a real-time corridor traffic control system. The off-line version (DIVSIM) contains DIVERT embedded in the traffic simulation program, SCOT. This version enables the user to exercise the algorithm via simulation in a specific corridor.

National Transportation Safety Board, Washington, DC. Office of Evaluations and Safety Objectives.
Safety Effectiveness Evaluation: Federal Highway Administration Non-Interstate Resurfacing, Restoration, and Rehabilitation Program.
22 Sep 81, 50p NTSB-SEE-81-4

The report analyzes the activities of the Federal Highway Administration (FHWA) to implement a national program for preserving and improving the non-interstate, Federal-aid Highway System through the use of Federal funds for RRR work. The report reviews the overall nature of the Federal-aid Highway Program; briefly describes the characteristics of the Federal-aid Highway System; and describes the general findings of the 'Report of the Secretary of Transportation to the Congress on the State of the Nation's Highways: Conditions and Performance (January 1981)'. Finally, the report closely reviews and analyzes the three major rulemaking notices issued by the FHWA on the RRR program since 1976, including the 'cost/benefit analysis' published by the FHWA in support of the rulemaking effort. The Board found that the FHWA has not developed a coherent program for RRR work based on reliable research that would provide a basis to measure the program's safety and durability impacts. The Board concluded that the 5-year rulemaking record is contradictory, unsupported by fact, and seriously misleading. The report is critical of the FHWA's argument that use of lower standards can provide 'greater systemwide safety' than higher standards because more miles of roads can be improved. The cost/benefit study does not support that claim.

Collection and Use of Pavement Condition Data.
Final rept.
Jul 81, 83p TRB/NCHRP/SYN-76, ISBN-0-309-03161-3
Sponsored in part by American Association of State Highway and Transportation Officials, Washington, DC., and Federal Highway Administration, Washington, DC. Library of Congress catalog card no. 81-52689. Also pub. as ISSN-0547-5570. Report on National Cooperative Highway Research Program, Synthesis of Highway Practice.
Paper copy also available from Transportation Research Board, 2101 Constitution Ave., NW, Washington, DC. 20418.

This synthesis will be of special interest and usefulness to highway designers, researchers, and others concerned with pavement management. The report reviews current practices of collecting pavement condition data for use in making decisions on maintenance, rehabilitation, and reconstruction. To develop this synthesis in a comprehensive manner and to ensure inclusion of significant knowledge, the Board analyzed available information assembled from numerous sources, including a large number of state highway and transportation departments. A topic panel of experts in the subject area was established to guide the researcher in organizing and evaluating the collected data, and to review the final synthesis report.

Effects of Synfuel Use.
Journal article,
Masood Ghassemi, Rajan Iyer, Robert Scofield, and Joe McSorley. Nov 81, 10p EPA-600/J-81-481
Pub. in Environmental Science and Technology, v15 n8 p866-873 Aug 81.

This paper reviews environmental concerns relating to the distribution, handling, and end use of synfuel products likely to enter the marketplace by the year 2000, and assigns priority rankings to the products based on environmental concerns to aid EPA to focus its regulatory and research activities. Major products and by-products from oil shale, coal liquefaction, and coal gasification technologies are considered. Results indicate that: (1) significant quantities of synfuel products are expected to enter the marketplace during the next 20 years; (2) large-scale transportation, distribution, and end use of certain synfuel products can present significant threats to the environment and the public health; (3) based on gross characteristics, synfuel products appear to be similar to petroleum products, but detailed characterization data are not available with which to judge their relative safety; and (4) synfuel test and evaluation programs currently underway or planned provide excellent opportunities for collecting some of the required environmental data. Three likely scenarios for shale- and coal-based synfuel plant buildup are projected. The type and quantity of synfuel products and by-products likely to enter the market are identified and their regional market penetration is estimated. The environmental analysis consists of a review of available data on the physical, chemical, and health effects characteristics of synfuel products and environmental significance of their characteristics.

Aerosol Sampling Inlets and Inhalable Particles.
Journal article,
Benjamin Y. H. Liu, and David Y. H. Pui. 19 Jun 80, 14p EPA-600/J-81-026
Grant EPA-R-804600
Pub. in Atmospheric Environment, v15 p589-600 1981.

The problem of sampling aerosols from the ambient atmosphere has been considered from a theoretical point of view. Following a review of the various samplers and inlets used in ambient sampling, the factors contributing to high sampling efficiency for large particles are discussed. It is pointed out that the major mechanisms for particle loss in sampling inlets are impaction on external surfaces and impaction, turbulent deposition, and sedimentation on internal surfaces. Therefore, an efficient inlet is one for which these losses are minimized. Based on these theoretical considerations, a new inlet for sampling inhalable particles (particles with aerodynamic diameter of 15 micrometers or less) has been designed, constructed, and tested. The inlet incorporates an inlet configuration allowing for the efficient entry of large particles into the inlet opening, followed by an impactor to remove the coarse, non-inhalable particles. The inlet has been found to have essentially wind speed independent characteristics for wind speeds of up to 9 km/hr, the maximum wind speed used in the tests. The impactor has also been found to have sharp cut-off characteristics with a sharpness of cut parameter, sigma g, of 1.18. It is believed that this particular inlet will meet the requirements of a high efficiency inlet for sampling inhalable particles from the ambient atmosphere.

Removing Trihalomethanes from Drinking Water - An Overview of Treatment Techniques.
Journal article,
James M. Symons, Alan A. Stevens, Robert M. Clark, Edwin E. Geldreich, and O. Thomas Love, Jr. 1981, 12p EPA-600/J-80-360
Pub. in Water/Engineering and Management, 128, p50, 52, 53, 56, 61-64 Jul 81.

In 1974 trihalomethanes (chloroform, bromodichloromethane, dibromochloromethane, and bromoform) were discovered to be formed during the disinfection step of drinking water if free chlorine was the disinfectant. This, coupled with the perceived hazard to the consumer's health, led the U.S. Environmental Protection Agency to amend the National Interim Primary Drinking Water Regulations to include a maximum contaminant level of 0.10 mg/L tor total trihalomethanes. For trihalomethane removal, aeration - either by diffused-air or with towers - and adsorption - either by powdered activated carbon or granular activated carbon - is effective. The major disadvantage of this approach is that trihalomethane precursors are not removed by aeration. For trihalomethane precursor control, effective processes are: (1) oxidation by ozone or chlorine dioxide; (2) clarification by coagulation, settling and filtration, precipitative softening, or direct filtration; or (3) adsorption by powdered activated carbon or granular activated carbon. In addition, some modest removal or destruction of trihalomethane precursors can be achieved by oxidation with potassium permanganate lowering the pH, or moving the point of chlorination to the clarified water. Lowering of trihalomethane precursor concentrations has the additional advantage of reducing overall disinfectant demand, thereby reducing the possibility of the formation of all disinfection byproducts. Neither chlorine dioxide, nor ozone, nor chloramines produce trihalomethanes at significant concentrations when used alone as disinfectants. Furthermore, the cost of any of these unit processes is very low. The major disadvantage of using alternate disinfectants for trihalomethane control relates to the lack of any precursor removal.

Aerosol Formation in Urban Plumes.
Journal article,
Kenneth T. Whitby. c1980, 21p EPA-600/J-80-358
Grant EPA-R-803851
Pub. in Annals of the New York Academy of Sciences, v338 p258-275, 15 May 80.

One of the most important questions of the day is exactly how to measure the contribution of identifiable sources to the increasing haze that now covers a good part of the eastern United States in summer. This concern has resulted in a number of large studies of point sources, such as power plants. However, the multitude of small sources in every urban area also combine to form an urban plume that not only contributes to the pollution in the downwind areas immediately under it, but also to the general haze after the plume has lost its identity. Furthermore, the author has only a sketchy idea of what such plumes contribute to the general haze on the days after they have lost their identity. Although it is well known that secondary aerosol mass and O3 are formed in the urban plume, quantitative relationships between primary precursors and secondary products are scarce.

Environmental Speciation and Monitoring Needs for Trace Metal-Containing Substances from Energy-Related Processes: Proceedings of the DOE/NBS Workshop Held at the National Bureau of Standards in Gaithersburg, Maryland on May 18-20, 1981.
Final rept.,
Frederick E. Brinckman, and Richard H. Fish. Nov 81, 339p NBS-SP-618
Sponsored in part by Department of Energy, Washington, DC. Office of Health and Environmental Research. Library of Congress catalog card no. 81-600140.

This book presents the Proceedings of the DoE/NBS Workshop on Environmental Speciation and Monitoring Needs for Trace Metal-Containing Substances from Energy Related Processes held at the National Bureau of Standards , Gaithersburg, MD, on May 18-20, 1981. The Workshop was sponsored by the Office of Health and Environmental Research, DoE, and the Office of Recycled Materials, NBS. The volume contains refereed papers submitted by 24 invited speakers, along with substantially complete text of the discussion following the papers, edited by the Co-chairpersons. The Proceedings address three major topic areas forming the overall objective of the Workshop: (1) What are the general and specific types of metal- or metalloid-containing substances occurring in energy-related process materials such as coals, oil shales, and waste products. (2) What are the current status and future prospects of element- and compound-specific measurement methods suitable for speciation of trace (ppm, ppb) metal- and metalloid-containing substances transmitted to the environment by energy-processing or waste cycling technologies. (3) For what toxic molecular forms of speciated process effluents should biological dose-response data be generated to assure reliable environmental impact and monitoring measurements. Main questions focused on providing

assurance that the speciation methods (or their development) fit basic bioassay criteria along with appropriate standard reference materials for meeting quantitative process and waste monitoring or control needs.

Alternative Sign Sequences for Work Zones on Rural Highways. Executive Summary.
Final rept. Apr 77-Aug 80,
Richard W. Lyles. May 81, 19p FHWA/RD-80/162
Contract DOT-FH-11-9401
Prepared in cooperation with Mane Univ. at Orono. Social Science Research Inst. See also PB82-132820.

The report summarizes the results of two experiments, sponsored by the FHWA and carried out at the Maine Facility, which examined the effectiveness of several alternative sign sequences for warning motorists on a two-lane rural road that there are construction/maintenance activities ahead which require closure of one lane. Types of signs tested include typical MUTCD warning signs, flasher augmented signs, and symbol signs. Principal findings concluded that flasher augmented signs were most effective in slowing approaching motorists and symbol signs were always at least as effective as the typical warning signs with word messages.

Analyses, Experimental Studies, and Evaluations of Control Measures for Air Flow and Air Quality on and Near Highways. Volume I: Experimental Studies, Analyses, and Model Development.
Final rept. 1973-80,
Walter F. Dabberdt, Eugene Shelar, David Marimont, and George Skinner. Mar 81, 273p FHWA/RD-81/051
Contract DOT-FH-11-8125
See also Executive Summary, PB82-133596, and Volume 2, PB82-133612. Errata sheet inserted.
Also available in set of 4 reports PC E18, PB82-133588.

Experimental and theoretical investigations have been made of meteorological and air quality conditions near a broad range of complex roadway configurations. These are described, and some new insights into the interrelationships among traffic, meteorology, and configuration are discussed. The development of a new and versatile dispersion model, called ROADMAP, is also described together with an evaluation of the model's performance relative to measured atmospheric and wind tunnel pollutant concentration data. The experimental data indicates a significant effect of waste heat on near-roadway dispersion. The combined effects of traffic movement and waste heat emissions cause increases in the turbulence intensity of up to 200% across the roadway. However, there is apparently little effect on turbulence caused by changes in traffic volume or speed (for the moderate-to-heavy traffic conditions present during the tests). An aerodynamic or shelter effect is postulated to exist and to be a significant influence for grade-level roads.

Jamaica Feeder Roads: An Evaluation.
Project impact evaluation rept. no. 11,
Robert J. Berg, Carleen Gardner, Michael M. Horowitz, Palmer Stearns, and Charles Vandervoort. Nov 80, 103p AID-PN-AAJ-199
Prepared in cooperation with State Univ. of New York at Binghamton, and Department of Transportation, Washington, DC.

Although it upgraded a total of 181 miles of rural roads between 1972 and 1976, the Jamaican feeder roads project failed to have any demonstrably significant benefits. This report investigates the causes of that failure by examining the logic, appropriateness, and achievement of the project's goals. The authors conclude that the haste brought about by the project's high political priority ultimately caused its failure. A more methodical design and review process would have revealed the ineffectiveness of the rural roads approach and its propensity for failure. These conclusions are particularly important since politically-oriented foreign assistance from any source could encourage repetition of similar difficulties.

Improvement of Hot-Side Precipitator Performance with Sodium Conditioning--An Interim Report.
Journal article,
J. P. Gooch, R. E. Bickelhaupt, G. H. Marchant, Jr, R. D. McRanie, and L. E. Sparks. Mar 81, 9p EPA-600/J-81-482
Pub. in Air Pollution Control Association Jnl, v31 n3 Mar 81. Prepared in cooperation with Electric Power Research Inst., Palo Alto, CA.

The article reports on a research project (sponsored by EPA, EPRI, and Southern Company Services) to evaluate sodium conditioning as a possible solution to performance deficiency problems encountered at a number of major utility plants during the development of an unexpected, time-dependent degradation of performance of hot-side electrostatic precipitators (ESPs) collecting ash from certain coals (usually low-sodium low-sulfur coals). The article concludes that sodium conditioning produced by sodium sulfate addition to the coal supply is an effective way to improve the performance of a hot-side ESP which has undergone the sodium-depletion high-resistivity pattern of performance deterioration. Although the reported results are believed to be of general significance, certain characteristics of the operating parameters at Gulf Power Co.'s Lansing Smith plant are noteworthy with regard to the success of the conditioning process. First, ash concentration and composition, and boiler design, allowed the addition of the required amount of sodium without creating boiler operating problems. Secondly, the calcium content of the coal was moderate, and there is some evidence that high calcium concentrations would require more sodium addition for the same degree of resistivity reduction. Applicability of the process for other ash chemistries and operating conditions remains to be determined.

Survey of On-Going and Completed Remedial Action Projects.
Final rept. Apr-Oct 80,
N. Neely, D. Gillespie, F. Schauf, and J. Walsh. Sep 81, 242p EPA-600/2-81-246
Contract EPA-68-01-4885
Color illustrations reproduced in black and white.

During the summer of 1980, a nationwide survey was conducted to determine the status of remedial actions applied at uncontrolled hazardous waste disposal sites. Over 130 individuals were contacted to obtain information on such remedial action projects. A total of 169 sites were subsequently identified as having been subject to corrective action. Remedial actions were found to have been implemented at many kinds of hazardous waste disposal facilities including drum storage areas, incinerators, and injection wells, but most frequently landfill/dumps and surface impoundments. At the sites receiving such remedial actions, ground water was found to be the most commonly affected media, followed closely by surface water. Although several types of remedial measures were identified, remedial activities usually consisted of containment and/or removal of the hazardous waste. Sufficient money was often not available for complete environmental cleanup (e.g., extraction and treatment). The survey determined that a lack of sufficient funds and/or selection of improper technologies was responsible for remedial actions having been applied effectively at only a portion of the uncontrolled hazardous waste disposal sites. Nine sites were studied in detail to document typical pollution problems and remedial actions at uncontrolled hazardous waste disposal sites.

Scavenging of Aerosol Particles by Precipitation.
Journal article,
Lawrence F. Radke, Peter V. Hobbs, and Mark W. Eltgroth. 23 Mar 80, 10p CONTRIB-534, EPA-600/J-80-355
Grant EPA-R-805203
Pub. in Jnl. of Applied Meteorology, v19 n6 p715-722 Jun 80.

Airborne measurements have been made of aerosol particle size distributions (>0.01 micrometer) in aged air masses, in the plumes from several coal power plants and a large Kraft paper mill, and in the emissions from a volcano, before and after rain or snow showers. These measurements have been used to deduce the precipitation scavenging collection efficiencies of aerosol particles ranging in size from approximately equal to 0.01 to 10 micrometers diameter. Despite large variations in the nature of the aerosol particles and the precipitation, the scavenging collection efficiencies as a function of particle size showed marked similarities, with some well-defined maxima and minima values. The measurements agree well with theoretical calculations for aerosol particles use than 1 micrometer, but for the submicron aerosol particles the scavenging collection efficiencies are generally much higher, and the region of very low scavenging efficiencies (the 'scavenging gap') much narrower, than current theories predict. Some possible explanations for these discrepancies are suggested.

A Review of Numerical Methods for the Analysis and Design of Soft Ground Tunnels.
M. J. Gunn. 1981, 181p CUED/D-SOILS/TR-114-1981
Sponsored in part by Transport and Road Research Lab., Crowthorne (England). Also pub. as ISSN-0309-7439.

The last two decades have witnessed a steady fall in the cost of digital computers and also an increase in computing power (both speed and storage) of the machines available. A parallel development has taken place in the application of numerical methods (using those same computers) to all branches of engineering. The scope of this review is the degree of success that can be expected when various numerical methods are applied to problems associated with soft ground tunnelling. The view taken here of what constitutes a numerical method is rather wider than the view likely to be taken by a numerical analyst or computer scientist. For the purposes of this review any method of analysis

which is made more convenient by the use of a digital computer is a numerical method. Thus the review discusses some methods which are analytical rather than numerical. The first reason for this is (as has just been suggested) a computer would be used to tabulate numerical results from some analytical solution (e.g. obtained via the theory of elasticity). The second reason is related to a particular view of numerical modelling: the results of such analysis should lead to a simpler view of the problem. Although a numerical model may contain an elaborate set of assumptions the engineer should examine the results to determine the dominant physical processes and hopefully a simpler (analytical) model of the situation.

Kielder Aqueduct Tunnels - Predicted and Actual Geology,
T. P. Davies, P. G. Carter, D. A. C. Mills, and G. West. c1981, 48p TRRL-SUPPLEMENTARY-676
Also pub. as ISSN-0305-1315.

The Kielder tunnels are part of the Northumbrian Water Authority's Kielder Water Scheme and constitute the major element of an aqueduct linking the rivers Tyne, Wear and Tees. The 32 km length of hard rock tunnel traverses a varied sequence of sedimentary Carboniferous strata with limited occurrences of intrusive igneous rocks. Full-face tunnel boring machines were used for most of the tunnel length, with shorter sections being driven using drill-and-blast methods and a roadheader. The report describes the site investigations undertaken and how the information gained was used to assess the suitability of alternative excavation and support methods. Conditions encountered during construction are compared with predictions derived from site investigations; discrepancies are discussed and means whereby these might have been reduced are considered with the intention of facilitating good future site investigation practice. (Copyright (c) Crown Copyright 1981.)

Determining Optimum Routes from Maps,
N. B. Taylor, and D. J. Jeffery. c1981, 39p TRRL-LR-1001
Also pub. as ISSN-0305-1293.

A simple method for estimating journey times and costs directly from maps is described together with the results of a validation experiment involving travel over all types and classes of urban and rural roads both in and out of peak hours. The results are used in conjunction with a computer simulation of a road network, involving 2,300 km of classified and unclassified roads in and around the county of Berkshire, to show that the method can be used to select minimum cost routes, and that the selected routes will not differ from the true optimum by more than about 0.2 percent averaged over all trips, regardless of journey length. Formula are obtained which relate the inaccuracy, or excess, of optimum routes selected by the model to the magnitude of error in time or cost estimates on individual road sections, and the effect of junction delays is quantitatively discussed. It is shown that the model should be applicable, without calibration or modification, for all areas of the country. (Copyright (c) Crown Copyright 1981.)

Site Investigation and Construction of the Cardiff Cable Tunnel,
G. West, and D. McLaren. c1981, 29p TRRL-LR-1012
Also pub. as ISSN-0305-1293.

The site investigation and construction records for the 1.5 km long Cardiff cable tunnel have been examined to see whether they can give lessons of good practice for tunnel site investigation. The tunnels were constructed wholly within the Keuper Marl; excavation was mainly by full-face tunnelling machine and lining was with pre-cast concrete bolted segments. The report describes the site investigation and construction of the works in some detail with special emphasis on ground conditions. On this site preliminary information proved most useful. The site investigation gave a generally satisfactory account of the site geology. However, points to emerge from the study were that if mechanized tunnel excavation is a possibility and the ground is predominately soft, then bands of harder material at tunnel depth take on extra significance and must be carefully recorded and tested. Rock strength test results in the site investigation report should be carefully considered when making a choice of method. If the operating conditions call for a watertight tunnel close attention should be given to permeability results in the site investigation report which show the possibility of high ground water flows. National Research Council, Washington, DC. Water Resources Research Review Committee.
Federal Water Resources Research: A Review of the Proposed Five-Year Program Plan.
1981, 92p W82-01051, OWRT-C-00086-G-0426(1)
Contract DI-14-34-0001-0426

The Water Resources Research Review Committee studied the 1975 assessment of the nation's water resources by the U.S. Water Resources Council and other recent reports that highlight pressing water problems. The Committee then developed criteria by which to determine the research areas of highest priority. Using these criteria, the Committee identified thirty-one research areas where emphasis should be placed in programming water resources research over the next five years. The thirty-one research areas are described in relation to the professional disciplines in the report.

The Minibuses and the Public Transport System of Kuala Lumpur,
Jamison Mackay. c1981, 35p TRRL-SUPPLEMENTARY-678
Also pub. as ISSN-0305-1315.

This report is one of a series of studies undertaken by the TRRL, examining public transport in developing countries, and describes the minibus system of Kuala Lumpur, Malaysia's capital and largest city. In 1975 a fleet of minibuses was introduced into the city, operating in competition with the existing stage buses. The operation and service of the minibus system is examined to determine why it has been so successful in attracting passengers away from the conventional stage bus system. While the stage bus is more efficient per unit of capacity, various institutional factors have made the minibus more successful. (Copyright (c) Crown Copyright 1981.)

Development of a Test Trailer for High-Volume Skid-Resistance Surveys.
Final rept.,
M. W. Fitzpatrick. Dec 77, 63p FHWA/NY-77-RR45

A skid trailer system was successfully designed, built, and tested to conform with ASTM Designation E274-70. (It also meets the newly adopted ASTM Designation E274-77.) It is now performing its intended function of routinely surveying the statewide highway system. This report describes the design philosophy and evaluation of the system after its construction. The design is concluded to be sound, but some changes should be included by anyone wishing to copy it. Appended are the specifications used to obtain the truck and baffled water tank, and a descriptive list of all the trailer's structural parts. Detail drawings are not included, but are available on request.

Epoxy Thermoplastic Pavement Marking Material: Specification and Testing.
Interim rept. Dec 78-Jul 80,
Brian H. Chollar, and Bernard R. Appleman. Sep 80, 109p FHWA/RD-80/069

This report presents the results of an extensive laboratory program to establish a specification for an epoxy thermoplastic (ETP) striping material which was developed in a contract research study for the Federal Highway Administration by Southwest Research Institute. The present study developed laboratory test procedures to evaluate the significant properties of the ETP material and its components. Properties studied included viscosity, reflectance, thermal stability, softening point, epoxy equivalent weight, and infrared spectrum. Also studied were the effects upon selected ETP properties of variations in the composition ratios of the ETP components and variations in the epoxy resin properties. From a statistical analysis of the results, upper and lower limits for the ETP physical properties were determined. An interim composition performance specification was then established for the procurement of this material based on epoxy resins manufactured by CIBA-GEIGY and various commercial pigments. Analytical procedures for determining titanium dioxide, lead chromate, glass bead, and organic contents were also incorporated into the specification.

Flexible Pavement Overlay Design Procedures. Volume 1. Evaluation and Modification of the Design Methods.
Final rept. Sep 77-Nov 80,
Kamran Majidzadeh, and George J. Ilves. Aug 81, 184p FHWA/RD-81/032
Contract DOT-FH-11-9315
See also Volume 2, PB82-136680.

The objectives of this research report is to provide the pavement engineer with a rational and ready reference to design procedures for asphaltic concrete overlay of flexible pavements based on elastic layer theory. The design procedures and the analytical techniques presented have been formulated to predict the structural fatigue response of asphaltic concrete overlays for various design conditions, including geometrical and material properties, loading conditions and environmental variables.

Dioxins.
Final rept.,
M. P. Esposito, T. O. Tiernan, and Forrest E. Dryden. Nov 80, 371p EPA-600/2-80-197
Contracts EPA-68-03-2577, EPA-68-03-2659
Sponsored in part by Contract EPA-68-03-2579. Prepared in cooperation with Wright State Univ., Dayton, OH., and Walk, Haydel and Associates, Inc., New Orleans, LA.

This report deals with a group of hazardous chemical compounds known as dioxins. The extreme toxicity of one of these chemicals, 2,3,7,8-tetrachlor-dioxin (2,3,7,8-TCDD), has been a concern of both scientific researchers and the public for many years. The sheer mass of published information that has resulted from this concern has created difficulties in assessing the overall scope of the dioxin problem. In this report, the voluminous data on 2,3,7,8-TCDD and other dioxins are summarized and assembled in a manner that allows comparison of related observations from many sources; thus, the report serves as a comprehensive guide in evaluation of the environmental hazards of dioxins. Sections 2 and 3 present detailed information on the chemistry and sources of dioxins. Various routes of formation of dioxins are discussed, and the possible presence of doxins in basic organic chemicals and pesticides is addressed. Section 4 details the development of an analytical method for detecting part-per-trillion levels of dioxins in industrial wastes. Sections 5 through 8 discuss routes of human exposure to dioxins, including accounts of public and occupational exposure, and the health effects, environmental degradation, transport, and disposal of dioxins.

Field Study of Pile Group Action. Appendix A.
Final rept.,
H. B. Ha, and M. W. O'Neill. Mar 81, 106p FHWA/RD-81/003
Contract DOT-FH-11-9526
See also Appendix B, PB82-137647.

This report is the final report for a study involving the static vertical load testing of a full scale, instrumented pile group. The test group consisted of nine pipe piles instrumented for settlement, load transfer, pore pressures, total pressures and inclination. Two similarly instrumented reference (control) piles were also installed. Two smaller subgroups within the main group were also tested, and uplift tests were conducted on several of the individual piles. The soils at the test site consisted of clays that were overconsolidated by desiccation. It was determined that the efficiency of the main group and of the subgroups was essentially unity. Settlement ratios in the working load range were found to vary from about 1.2 to about 1.7, depending on the number of piles that were loaded. Failure was observed to be by plunging of the individual piles. Unit side load transfer varied essentially linearly with depth. Some dependence of load transfer patterns on residual stresses that remained after driving the piles was observed. The measured behavior of the group and subgroups was modeled by the 'hybrid' algorithm, by means of Program PILGP1, which was developed for this study and documented in Appendices A and B.

User Charge Revenues for Wastewater Treatment Plants--Insufficient to Cover Operation and Maintenance.
Report to the Congress.
2 Dec 81, 46p CED-82-1

Half of the 36 municipal wastewater treatment plants GAO reviewed in 10 States were not raising sufficient funds from their user charge systems to cover operation and maintenance costs. Only 3 of 36 municipalities were setting aside funds to replace treatment plants when they reached the extent of their economical/technological life. Many municipalities indicated that they would return to the Federal Government for replacement funding. GAO is recommending actions to improve administration of the user charge program. GAO also believes the Congress should consider who will be responsible for funding future treatment plant replacement.

Controlling Nitrogen Oxides.
Research summary,
Alice Hastings, and Mark Schaefer. Feb 80, 29p
EPA-600/8-80-004
Contract EPA-68-01-4839

Recent research indicates that nitrogen oxides (NOx) could be one of the most troublesome air pollutants of the 1980's. More than 20 million metric tons of NOx are annually polluting our air as a result of the widespread combustion of fossil fuels in power plants, industrial boilers, and automobiles and trucks. Present levels of NOx emissions already pose a significant threat to our health and environment. Nitrogen oxides are directly harmful to human health, and are precursors of photochemical oxidants such as ozone, the major component of urban smog. They can also be converted into nitric acid, one of the two principal components of acid precipitation. The EPA is actively working with other Federal agencies and the academic, industrial, and private research communities to develop viable combustion technologies which will strictly limit NOx emissions. The authors have prepared this Research Summary to inform the public of the status of their efforts to make improved control technologies available as soon as possible.

Integrated Traffic Simulation Model - Phase I. Volume 4: Revisions to UTCS-1 Traffic Simulation Model to Enhance Operational Effectiveness.
Final rept. Sep 76-Dec 79,
E. Lieberman, and A. Wu. Sep 80, 68p FHWA/RD-80/089
Contract DOT-FH-11-9145
See also Volume 3, PB82-139171.

This report describes revisions to the UTCS-1 Traffic Simulation Program to reduce computing (CPU) time, reduce data transfer (I/O) operations, and to reduce storage requirements. The work effort included the refining of the existing code; Incorporating the capability for a variable simulation time-step; Abridging the existing fuel consumption and vehicle emission rate tables; Packing the above tables to conserve storage; and Revising two major routines and developing a new car-following model. The estimated result is to reduce CPU time by at least 30 percent, reduce I/O operations by at least 90 percent and reduce required storage by approximately 10 percent.

Grant NSF-PFR79-18267
Portions of this document are not fully legible.

Two-dimensional finite element techniques which use the complex response method and therefore permit variations in modulus and damping in different elements of a soil structure have been extended to three dimensions, with a constraint on the possible deformations of the finite element model. The present version of the computer program TLUSH constitutes a further development of these procedures and includes the following: complete freedom for the selection of the direction of the earthquake motions, complete freedom in the deformational modes of the model, a new interpolation scheme, a nodal point and element data generation routine, more efficient element stiffness generation routines and a more efficient program structure that has lower memory requirements. The program TLUSH can take into account the strong nonlinear effects characteristic of soil masses subjected to strong earthquake motions. This is achieved by a combination of the equivalent linear method and the complex response method. Typical relationships between stiffness, damping and effective shear strains for sand and clay are provided within the program. Special options that permit creation of a permanent record of both input and basic information on the complete solution, and recovery of this information for iteration and output purposes are available within the program.

Increased use of coal in the generation of electricity has become national policy. With the anticipated accelerated use of coal as an energy source, a concomitant increase can be expected in the potential for impacts to fish and wildlife resources. The goal of this manual is to provide quantitative guidelines, where possible for evaluating the potential extent of habitat disturbance from waste constituent dispersal. Criteria are also provided for evaluating the potential for impact from trace elements in the waste. This manual is limited to combustion and emission-abatement waste-handling systems and impacts of wastes on fish and wildlife resources.

Urban Infill: Opportunities and Constraints.
Working paper,
Deborah Brett, Margery al Chalabi, and Stephen B. Friedman. Jul 79, 45p HUD-0000833
Contract HUD-H-2982

This paper discusses the advantages of urban infill as public policy, documents the problems associated with infill sites, identifies the amount of development that might be accommodated, and suggests how public agencies can make infill parcels more attractive for private development. Urban infill development is the economic use of vacant land in urban areas where water, sewer, and other public services already exist. Infill use results in the reduction of urban sprawl, less duplication of public facilities, preservation of valuable agricultural land, reduced energy costs, and increased tax revenues for older cities and suburbs. The private sector, however, has not developed infill sites because of inadequate capacity and condition of public facilities, developer and consumer willingness to assume the costs of new facilities in outlying areas, and lack of coordination in facility planning and service provision. Land speculation, corporate holding of infill land in reserve, tax delinquency and fragmented ownership issues, and ineffective marketing, among others, also discourage use of infill land. Recent changes in real estate development favoring infill are property tax limitations, surburban growth controls, changing demographics, availability of financing and insurance, and energy considerations. Some potential adverse impacts of infill use are reduction of open lands and of future development options, inflated land and construction costs, and greater State and regional action than was previously acceptable. Research and policy issues are listed.

Productivity Trends in the Construction Industry: A Comparative International Review,
E. Jay Howenstine. 14 Sep 72, 36p HUD/IA-60, HUD-0000958

This overview of European and American studies of construction productivity trends examines long - term productivity in the industry as a whole, productivity trends in specific onsite studies of a man - hour performance, and comparisons of productivity trends in construction with those in the economy as a whole. While the rate of growth in U.S. construction productivity in the pre - World War II period was about 1 percent or less, in the postwar period (1950 - 1970), the growth rate was around 2 percent to 2.5 percent, compared to 4 percent to 6 percent in Europe. However, according to the most comprehensive study of economywide productivity trends during 1953 - 1967, the average European rate of productivity increase in the construction sector was over seven times the U.S. rate. During the postwar period, at least seven countries experienced substantial periods of higher rates of construction productivity growth than in the economy as a whole. In the majority of countries, including the United States, the reverse has been true, although man - hour productivity in the American construction industry appears to be generally higher than in the European construction industry. If further examination confirms that these magnitudes are approximately correct, then the conditions which have enabled European construction to achieve a rate of productivity improvement at least double that of the United States must be identified. Tabular data and footnotes are provided. (Author abstract modified).

Proposition 13 Research Inventory: A Partial Inventory of Research in the State of California and Elsewhere,
Nicholas D. Bevilacqua, and Theresa M. Larson. Sep 78, 104p HUD-0001984
Grant HUD-H-2944RG

This partial inventory presents research related to the impact of California's Proposition 13. The inventory is intended to (1) identify researchers, sponsoring agencies, and research issues; (2) indicate those areas not being considered and where research should be done; (3) identify data sets available for cooperative research efforts; and (4) provide practitioners in State and local government with ongoing research information. The following research areas are covered: alternatives to the public sector, community and economic development, energy, environment, and fire safety and disaster planning. Other areas are governmental reform and reorganization, health, human services, intergovernmental relations, management, finance, personnel, and police and the criminal justice systems. The inventory also includes political process / social behavior, public education, public works and utilities, revenue, taxation, economics, and transportation research. Generally, topics for each issue area are organized according to project title, principal investigator, research organization, sponsoring agency, grant number, study period, data sets (available or to be collected), and project description (purpose, methodology, product). There is an index to cross reference the work by principal investigator, research organization, sponsoring agency, and State agencies. Each issue area is categorized by key words.

State Tax Policy and Urban Economic Development,
Frank Keefe. Oct 79, 22p HUD-0002063
Contract HUD-H-4435

The speech on State governments' role in urban economic development was presented at a summit meeting of over 150 municipal officials in the Northeast. A critical factor in the failure of previous efforts to save the Nation's cities has been the lack of a central role for State governments. Local officials must assist State policymakers in planning their aid programs, particularly regarding the efficacy of various tax break schemes which States have proposed as short - term solutions to urban economic problems. A review of the literature reveals four standard myths concerning

taxes and economic development of which States must be aware. These myths suggest that a reduction in taxes on business will stimulate private investment and create new jobs, that a reduction in overall business taxes in the Northeast will attract firms back from the South, that special State tax breaks will generate new tax revenue through business expansions and employment growth, and that personal taxation has nothing to do with economic development and private investment. The speaker refutes these myths and suggests that State and local economic development policies in the Northeast be reevaluated. Nine references are cited, and the names of four persons interviewed for the speech are appended.

Negotiating Fiscal Impacts: A Handbook for Evaluating City Development.
Feb 80, 122p HUD-0002064
Contract HUD-H-4435
Prepared in cooperation with Herr (Philip B.) and Associates, Boston, MA.

This handbook is designed to assist Northeast municipal governments in determining the tax consequences of development proposals. It emphasizes simple approaches which can be easily done by those officials who represent the city in fiscal negotiations or make final decisions and is directed at large and stable or declining cities in the Northeast. Two levels of fiscal impact analysis are outlined: a level 1 sketch review, requiring an investment of about 4 hours in assembling and analyzing background data and perhaps 2 hours in reviewing any individual proposal, and a level 2 reconnaisance study, requiring an investment of about 8 staff hours for background study and another 4 hours for each project analyzed. The steps involved in both levels of analysis are described and illustrated. The steps involve a background study, structure proposal analysis, and proposal analysis. Only basic arithmetic is required, and the approaches outlined are the same for each level of analysis. Numerous exercises are included, and 10 references are cited.

United States Conference of Mayors, Washington, DC. Inst. for Urban and Regional Economic Analysis.
Three Major Issues Influencing Local Financial Management Capacity: The Perspective of Mayors.
Final rept.
02 Mar 81, 32p HUD-0002066
Contract HUD-H-5385SG

Mayors who were members of two standing committees of the Conference of Mayors were surveyed about their views and needs regarding the planning and management of capital infrastructure, energy management strategies for local officials, and informational needs in negotiating with the private sector. The mayors ranked these issues differently according to their cities' size, age, and geographic region. In addition, they viewed as crucial a fourth problem: managing accelerated growth caused by national energy exploration and defense policies. A clear ranking of the issues did not emerge, although the problem of informational needs for private sector negotiation was regarded as the least important. Energy management is clearly the most universal problem, except in the older cities of the Northeast and Midwest with deteriorating capital stock and growing gaps between revenues and expenditures. In addition, the oldest and largest cities see energy management mainly as an issue of cost identification and control and secondarily as preparation for shortage management. In contrast, the newer and larger cities see the energy management issue as also being deeply intertwined with efforts to market and expand public transportation. Furthermore, in the old Northeast and Midwest, planning and management of capital infrastructure are questions of dealing with disrepair and obsolescence, while in the Southwest and Rocky Mountain States, these are questions of the rational and cost - effective servicing of new growth. Appendices presenting a list of participants, a list of workshop documents, the format used in problem statements, and a list of delegates to the national needs assessment conference are provided. (Author abstract modified).

National Association of Counties, Washington, DC.
National Association of Counties' Report on Local Government's Priority Needs for Financial Management Capacity Sharing.
Jan 81, 215p HUD-0002068
Contract HUD-H-5388SG

The National Association of Counties (NACo) conducted three workshops in Minnesota and Florida in January 1981 to find out the priorities and needs of county officials in negotiating with the private sector; managing energy consumption and supply; and planning, managing, and maintaining capital infrastructure. This report describes its methodology and findings. The nominal group technique (involving silent generation of ideas, writing problems statements and solutions and voting on major problem statements) was used at each workshop as a way of finding solutions to a particular problem by a small participant group. Participants viewed State and Federal laws and regulations as the major local government problem because these regulations can keep the county from providing cost - effective services. County needs listed by participants included a system to determine contract cost - effectiveness and techniques to help counties to adequately and effectively plan for energy use and conservation. Participants also saw the main problem in capital infrastructure as the increasing deterioration of local roads, sewers, water treatment facilities, and transportation by bus or rail. These problems, needs, and concerns were presented by three NACo representatives at the HUD - sponsored national conference held February 4 - 6, 1981, in Washington, D.C., on 'Local Government Priority Needs for Financial Management Capacity Sharing.' The document includes a list of participants to NACo's preliminary workshops and representatives to the national conference. Attached are a description of the NACo County Research and Innovation Sharing Project; a letter from the executive director, Association of Minnesota Counties, with the Minnesota County Platform and an energy strategy of the Minnesota Counties Research Foundation; a list of selected resources and a paper on public management needs in negotiating with the private sector; and a letter on areas of suggested local governments needs.

Urban Air Pollution. August, 1979-November, 1981 (Citations from the NTIS Data Base).
Rept. for Aug 79-Nov 81.
Dec 81, 135p
Supersedes PB80-814429, and NTIS/PS-79/0768.

Selected reports are cited on urban air pollution and its abatement. These citations were selected because of their general interest to urban planners, which will enable them to become aware of new abatement strategies and techniques. The majority of the studies cover various aspects of transportation emissions. Other topics include health standards, atmospheric models to aid in planning, law enforcement, abatement policies, and the effects of new modes of transportation. (This updated bibliography contains 129 citations, 72 of which are new entries to the previous edition.).

Tensile Tests on Articulated Concrete Mattress Specimens.
Final rept.,
Dale Glass. Oct 81, 71p Rept no. WES/MP/SL-81-28

An investigation was undertaken to determine the feasibility of using crimps in the reinforcement in fabrication of articulated concrete mattress. The crimps would maintain the reinforcement in proper position during casting, thus eliminating the support system currently being used. In contrast to the straight reinforcing, crimps in the reinforcing caused cracking/spalling of the concrete in each panel tested. Overall, the initial concrete cracking/spalling load averaged 2449 lbf or approximately 47 percent less than the ultimate load as determined on panels with straight reinforcing. Overall, the ultimate tensile load of bracket wires with crimps averaged 50 lbf higher than bracket wires without crimps. Similarly, the ultimate tensile load of longitudinal wires with crimps averaged 84 lbf higher than longitudinal wires without crimps. (Author)

Evaluation of Tests for Determining the Pumpability of Concrete Mixtures.
Final rept.,
Steven A. Ragan. Oct 81, 53p Rept no. WES/MP/SL-81-29

This report evaluates two methods currently proposed for determining concrete pumpability: (a) the pressure bleed test method and (b) a checklist analysis which examines 10 variables of concrete mixtures and their effects on concrete pumpability. Part of the investigation consisted of a laboratory study in which 14 mixtures containing a combination of both rounded (natural) and angular (crushed) coarse aggregate, natural and manufactured fine aggregate, mineral admixtures, steel fibers, and a high-range water-reducing admixture were analyzed using both proposed procedures and then pumped. The other part comprised a field study in which two concrete mixtures were analyzed and then pumped at two project locations. One contained natural coarse and fine aggregate and the other contained manufactured coarse and fine aggregate. All concrete mixtures were air entrained. It was concluded that the pressure bleed test method is effective only in determining the pumpability of concrete using a poorly maintained and leaky pump. The checklist analysis, although conservative, is a better indicator of pumpability and should be considered for inclusion in an appropriate Engineer Manual or Engineer Technical Letter.

Stochastic Approach to Study the Influence of Rate of Loading on Strength of Concrete,
H. Mihashi, and F. H. Wittmann. 1980, 57p
Pub. in HERON, v25 n3 1980.

Although any reliability analysis depends on the entering load and resistance distribution functions, the actual materials behavior has been neglected in many reliability assessments. Strength of concrete is widely scattered because of the heterogeneity of this composite material. So far no generally accepted theory to describe the stochastic nature of concrete properties is available. Beside this, hardly anything is known on the influence of rate of loading on the variability of strength of concrete. In this paper, a stochastic theory for fracture of concrete materials is presented. This theory is based on physically relevant probability models. It is possible to describe the fracture process not only under monotonically increasing load, but also under time-dependent loading conditions such as sustained load and repeated load. Moreover, this theory provides a realistic basis for a mathematical formulation of the variability of porous materials. Theoretical predictions are compared with earlier published data. Experiments have been carried out to verify the theoretical approach described in this report. Special emphasis is placed on the influence of rate of loading on the mean strength and the corresponding variability. The rate of loading has been changed by three orders of magnitude and for most series six different rates have been chosen within this range. Specimens of high strength mortar, low strength mortar, lightweight and normal concrete have been tested under compressive and bending load. The distribution function has been evaluated from about 30 individual tests for each chosen condition of loading some experiments to investigate the influence of temperature have been carried out.

Improvement of Device (CMD) for Monitoring the Consolidation of Plastic Concrete.
Final rept.,
George J. Kirby, and Richard W. Lusignea. Aug 81, 72p DOT-7932, FHWA/RD-81/117
Contract DOT-FH-11-9630

This report describes a program to develop an automatic distance gauging system for use in a device (CMD) for monitoring the consolidation of a portland cement concrete pavement. The capacitive distance gauging system measures the air gap between the surface of the pavement and the bottom of a gamma backscatter instrument for density monitoring. The incorporation of the capacitance gauging system has successfully made the density measurement independent of air gap height variations normally encountered as the concrete pavement surface is extruded behind a paving machine. Laboratory and field testing programs are described, and recommendations are made for further development and application of the density monitoring system.

Recommendations for Road Surface Dressing.
c1981, 29p ROAD NOTE-39, ISBN-0-11-550554-7

Surface dressing can be used successfully on roads of all types, from the country lane that carries only an occasional vehicle to trunk roads and motorways carrying many thousands of vehicles a day. It provides a low-cost and basically simple form of maintenance but it frequently happens that less attention is paid to its control and supervision than is given to more expensive forms of construction. Lack of care may shorten the useful life of surface dressing, and the benefits of adequate control, particularly in the period when traffic is first allowed to pass over the new dressing, cannot be emphasized too strongly. The recommendations contained in this revised note are based on systematic full-scale trials and experiments undertaken over a period of many years by the Transport and Road Research Laboratory in close collaboration with various highway authorities and with industry. The note is designed to give guidance on the preparation of specifications necessary to cater for the wide range of traffic conditions and type of road surface likely to be encountered. Managers and supervisors of surface dressing programs should also consult 'A Guide to Road Surface Dressing Practice' which constitutes a code of practice on the execution of surface dressing operations. Concrete Mechanics. Part A. Theory and Experiments on the Mechanical Behaviour of Cracks in Plain and Reinforced Concrete Subjected to Shear Loading,
J. C. Walraven, and H. W. Reinhardt. 1981, 72p
Pub. in HERON, v26 n1A 1981.

As result of the increasing difficulties in structural design associated with the increase in scale and complexity of new structures and their loading conditions in recent years, added impetus has been given to the development of numerical calculation techniques. Above all, the nonlinear finite element methods, which are still being refined, may become powerful tools in future design. These methods, however, can only show to full advantage if the material characteristics to be inserted are adequately known. One of the characteristics affected by lack of information concerns the mechanism of transmission of forces across cracks whose faces are subjected to shear displacements. This mechanism is achieved by interaction of several components: axial and transverse stiffness (dowel action) of the reinforcement and direct transfer of forces between the rough concrete crack faces, generally denoted by the term 'aggregate interlock'. Experimental research and the derivation of a theoretical model gave insight into this phenomenon. Tests were carried out on precracked shear specimens. Variables in the tests were: the type of reinforcement (embedded reinforcing bars, external restraint bars), the concrete strength, the type of the concrete (sand gravel concrete, lightweight concrete), the grading of the concrete (continuous, discontinuous), the scale of the concrete, and the initial crack width. Measurements have been carried out for determining the shear force, the crack displacements and, for the specimens with external reinforcement, the force in the restraining bars.

Concrete Mechanics. Part B. Numerical Modelling of Bond-Slip Behaviour,
A. K. de Groot, G. M. A. Kusters, and T. Monnier. 1981, 94p
Pub. in HERON, v26 n1B 1981.

The development and verification of a numerical bond-slip element suitable for plain as well as for deformed (ribbed) reinforcing bars is reported. First, the formula for the axially symmetric case are derived; then the results are generalized to the three-dimensional case. Next, a procedure for effecting the transformation to the case of plane stress is proposed. After the theoretical treatment of the subject, the suitability of the bond-slip element is assessed with reference to experimental results. More particularly, these relate to tests on cylindrical specimens by Dorr and Mehlhorn, tests on rectangular prisms, and tests on specimens representing the end portions of beams. Finally, on the basis of the experience gained in the course of this verification, recommendations are made for the various parameters that govern the behavior of the bond-slip element.

Concrete Mechanics. Part C. Numerical Models for Reinforced Concrete Structures in Plane Stress,
H. J. Grootenboer, S. F. C. H. Leijten, and J. Blaauwendraad. 1981, 87p
Pub. in HERON, v26 n1C 1981.

This report delineates the development of two numerical models for the analysis of reinforced concrete structures in plane stress. In an introductory chapter the motives for this study are outlined and the essentials of reinforced concrete structures are reviewed. This survey indicates the need for analysis, which led to the decision to derive a Micro-model and a Macro-model. The Micro-model is a program based on a special type of finite element method for plates in plane stress. Material nonlinearities can be dealt with, but geometrical nonlinearity has not been taken into account. Bond and bond slip are modelled. Probably a feature which attracts most attention is the possibility of having discrete cracks across elements in any direction. This makes the program particularly well suited to simulate structures which fail in a brittle mode in which one crack or just a few cracks dominate their behavior. The program is called MICRO/1. The Macro-model is a program for plane beams and framed structures. Material nonlinearities as well as geometrical nonlinearities are dealt with. In this program the concept of 'smeared-out' cracks is applied. Only bond and bond slip between the main reinforcing bars and the concrete are modelled. The aim of the program is to calculate the global behavior of a beam up to failure load, rather than to study detailed stresses as in the case of the Micro-model. The Macro-model program is called MACRO/1.

Geometrical Non-Linearity in Collapse Analysis of Thick Shells, with Application to Tubular Steel Joints,
R. S. Puthli. 1981, 34p
Pub. in HERON, v26 n2 1981.

Geometrical nonlinearity is important, not only in problems involving elastic instability of thin structures, but also where they influence collapse in the material nonlinear range involving thicker members. Using a continuum approach, this paper presents the basic principles of the general finite element formulation for thick shells that have been incorporated in an existing general purpose computer program suite DIANA with a very modular architecture. The common assumptions of classical plate or shell theories have not been applied. Material nonlinearity has only been mentioned briefly, where it involves plasticity in structural steel. A comparison with the collapse analysis of a steel shell using conventional classical plate/shell theory is presented to illustrate variations that are ignored in classical theory. Experimental results on the collapse behavior of a tubular steel T-joint are briefly compared with a numerical simulation, where the theoretical effects of geometric or material nonlinearity alone are also presented.

General Derivation of Hardening Formulas,
A. K. de Groot, and G. M. A. Kusters. 1980, 46p
Pub. in HERON, v25 n1 1980.

The usefulness of the elasto-plastic arithmetical model for describing the behavior of a material such as concrete depends to a great extent on the hardening rules to be applied. Without going into the background of these rules and without expressing a preference, it will be endeavored in this article to give a general derivation of the hardening formulas, as opposed to the usual procedure of treating the hardening rules for each particular yield criterion. After the general derivation, the formulas are further developed for a number of well-known yield criteria. Furthermore, the possibility of interpolation between different hardening diagrams is discussed, without implying that the interpolation methods presented here are necessarily the most suitable. The need for some form of interpolation must be recognized, however. In many publications this problem is ignored, thus creating the impression that these are not matters likely to cause any difficulties. Finally, it is pointed out that the manner in which a particular yield criterion is formulated may sometimes make arithmetical treatment more difficult.

A Simplified Approach to Creep Buckling and Creep Instability of Steel-Concrete Columns,
A. W. de Jongh. 1980, 42p
Pub. in HERON, v25 n4 1980.

The effect of the creep of concrete on the physical and geometrical nonlinear behavior of concrete columns is dealt with in this article. The aim has been to achieve simplicity of treatment by choosing conveniently ma-

nipulatable mathematical models. The geometrical nonlinear behavior of columns is reduced to essentials with the aid of discrete kinematic models. The material strain behavior of concrete is schematized by rheological models. With the aid of these models the concepts of creep buckling and creep instability are analyzed. By creep buckling is understood the academic case of a slowly buckling straight strut under axial (centric) load. Creep instability denotes the real phenomenon of sudden instability of a column occurring a long time after load application in consequence of its attaining a critical deflection due to time-dependent effects. Further, the effect of the reinforcing steel in a concrete column upon the creep deformation behavior of the column is investigated. The choice of model enables the problems involved to be properly visualized, and qualitative insight into the extent to which various parameters affect the creep deformation behavior of concrete columns is obtained. The approach presented here can, for example, be useful in interpreting computer calculations or in assessing the creep sensitivity of a concrete structure.

The feasibility of impregnating bridge decks with methyl-methacrylate for protection against freeze-thaw deterioration and corrosion of the reinforcing steel is reported. Parameters such as monomer system, monomer loading, drying temperature and time, curing temperature and time, soak time and equipment were investigated and discussed. A non-destructive method for the determination of the polymer depth in a polymer impregnated concrete was investigated and reported. The three methods that are presently used to place polymer concrete overlay on bridge decks were tested and compared with each other.

This report discusses the use of impermeable, high strength, quick setting polymer concrete as a patching for deteriorated bridge decks. A complete procedure for bridge deck patching is presented. Both laboratory and field tests of polymer concrete were performed. Experiments include determination of cure time and compressive strength for various monomer mixes. Field patches on several Oklahoma bridge decks were placed with the help of the Oklahoma Department of Transportation. The two commercial patching materials, Dupont's Crylon and Rohm and Haas' Plexicrete were also tested. Formulation of the proper monomer system for a polymer concrete mix with suitable properties for bridge deck patching from 20F to 130F is presented. The cost of polymer concrete is estimated at about $16 per cubic foot of patch volume.

Polymer concrete is a quick setting, high strength, durable patching material used to repair reinforced portland cement concrete. Cure times of approximately one hour can be obtained from 20F to 130F. The complete patching procedure is discussed including the preparation of the patch, calculation of the amount of materials required, and the mixing and placing of the polymer concrete. Suppliers of the chemicals used are listed. Proper storage, disposal, and safety procedures are also outlined. The cost of polymer concrete is also calculated for the methyl methacrylate (MMA) system used in this study. A materials cost (early 1980) of about $16 per cubic foot or $430 per cubic yard is expected.

Sponsored in part by North Carolina State Dept. of Transportation, Raleigh.

Photographic comparison standards and an analysis procedure for their use have been developed to aid in the determination of the age of hydration and the water-cement ratio of hardened concrete. The standards are sets of nine photographs of concrete at a range of ages and water-cement ratios taken at 1200X magnification using the scanning electron microscope (SEM). Concretes were made at nine different water-cement ratios ranging from 0.40 to 1.20 in increments of 0.10 and hydration was terminated for samples from each water-cement ratio at 1, 3, 7, 14, 28, 60 and 90 days of hydration using controlled non-freezing vacuum drying. An array of 63 sets of nine photographs, one for each age at each water-cement ratio resulted. Analysis of their array resulted in the recognition of nine factors of features of the hydration matrix that can be used by a trained observer to estimate age of hydration and water-cement ratio of an unknown concrete sample for which a set of nine 1200X SEM photographs has been made. A step by step procedure is provided using the age and water-cement ratio distribution of the nine features for the evaluation of unknown concrete samples. Sample photographs illustrating the nine hydration features are provided together with a distribution chart for each feature.

Thermal Conductivity of a Concrete Mortar from 95 K to 320 K,
L. L. Sparks. Oct 81, 17p NBSIR-81-1651
Sponsored in part by Maritime Administration, Washington, DC.

The thermal conductivity of a single concrete mortar specimen with varying moisture content is reported in the temperature range from 95 to 320 K. The measurements were made in a guarded-hot-plate apparatus (ASTN C-177). Moisture migration caused by temperature gradients was minimized by studying the saturated specimen in the low-temperature region. Specimen moisture content and concomitant thermal conductivity were altered by imposing low-pressure, high-temperature conditions on the specimen. The effect of changing the moisture content is discussed.

Surface Dressing in Developing Countries: Research in Kenya,
L. S. Hitch. c1981, 43p TRRL-LR-1019
Also pub. as ISSN-0305-1293.

In many developing countries surface dressing is used as a running surface on new low-cost roads as well as a maintenance treatment for existing roads. These countries are usually characterized by combinations of road surface condition, traffic, climate, and materials, that are not found in Britain and that are not favorable for good surface dressing. In such cases the recommendations for road surface dressing given in Road Note 39 which is intended for use in Britain, are not applicable. Jackson (1963) has proposed a method of surface dressing design based partly upon ideas put forward by Hanson (1935). This method was used to design a total length of 27 km of experimental sections of surface dressing in Kenya during 1975-77. This report describes the construction, monitoring and performance of the sections during the first 3--4 years trafficking. It is concluded that Jackson's design method works satisfactorily in Kenya conditions over the range of chipping size used in these trials, namely 5 mm to 13 mm average least dimension. Acceptance Sampling of Steel Reinforcing Bars.
Research rept.,
John B. DiCocco. Nov 73, 39p NYSDOT-ERD-73-RR-18
Sponsored in part by Federal Highway Administration, Washington, DC.

Most sampling schemes in general use for inspection of construction materials are rule-of-thumb sampling plans, whose inefficiency has long been known. This is now being recognized nationally. To begin correcting this situation, the New York State Department of Transportation Materials Bureau requested that valid acceptance sampling plans be prepared for four construction materials. This report is the first of a series in response to that request, and deals with acceptance sampling of steel reinforcing bars. A new acceptance sampling plan is presented, designed to assure the quality levels set as requirements by the Department's Structures Subdivision. In addition, reasons and supporting data for the sampling plan chosen are also presented.

Influence of Irradiation on the Tensile Properties of Austenitic Stainless Steel Weldments.
F. W. Wiffen, D. P. Edmonds, J. A. Horak, and J. F. King. 1980, 17p CONF-8009179-6
Contract W-7405-ENG-26
ADIP program review meeting, Germantown, MD, USA, 30 Sep 1980.

Weldments in the first wall and front sections of the blanket of a fusion reactor will be exposed to approximately the same operating conditions as will the base metal. Thus the irradiation response of weld metal, of the weld heat affected zones in the base metal, and of the base metal are all of equal concern. Austenitic stainless steels will most likely be joined by a gas tungsten arc welding process. Welds have been made by this process between sections of 6-mm-thick (0.25 in.) base plate of type 316 in the 20%-cold-worked condition, with either type 316 or 16-8-2 stainless steel filler metal. Rod tensile specimens were cut through the welds, containing weld meta in the central gage portion. Weld-contaning tensile specimens have been irradiated in HFIR at 55 exp 0 C and throughout the temperature range 280 to 620 exp 0 C. The neutron fluences ranged from 0.5 to 1.6 x 10 exp 26 n/m exp 2 (> 0.1 MeV). The corresponding displacement damage levels range from 4.5 to 12.1 dpa, and the helium generation from the thermal neutron captures in nickel resulted in 100 to 550 at. ppM He. Identification of Wheelset/Rail Creep Coefficients from Dynamic Response Data Using the Maximum Likelihood Parameter Identification Technique.
Master's thesis,
William N. Herzog. Jan 79, 160p Rept no. AFIT-CI-79-254T

This thesis explores the application of the maximum likelihood parameter identification technique to determine the wheel/rail creep coefficients using dynamic response data. The equations of motion for the dynamically scaled wheelset are presented and the reduced form of the maximum likelihood equations as applicable to the dynamically scaled wheelset model are developed. The maximum likelihood equations were formulated into a maximum likelihood algorithm which was implemented in Fortran IV. Using simulated wheelset data, the effects of a random input representation of the track versus a deterministic input with uncertainty representation are determined. The effects of various levels of measurement noise are also examined. This preliminary analysis indicates that the deterministic representation of the track input yields better results. Representing the track as a random track input requires further investigation into the effects of longer data records and smaller time steps on the performance of the maximum likelihood algorithm. Method for Estimating Technological Penetration Rates in Commercial Automobile Fleets.
J. R. Wagner. Nov 80, 84p BNL-51312
Contract AC02-76CH00016

A technique for estimating market penetration rates of electric and hybrid cars in commercial (including police and nonfederal government) fleets is described. The approach is also applicable to other vehicle technologies in the fleet market. It employs survey data collected from 142 fleet operators in March 1979. The data describe physical and economic criteria used by fleet operators to select vehicles. This information, together with a variety of derived relationships and constants, provides the basis for a computer simulation model called CPEN (Fleet Car Market Penetration Simulator). The CPEN user provides data describing the physical and economic attributes of hypothetical vehicles. CPEN then produces market penetration estimates, based on the physical capabilities, purchase prices, and discounted life-cycle costs of alternative vehicles. (ERA citation 06:035108)

The availability of public transit systems in rural areas has generally declined over the past two decades. Major new federal programs, however, are beginning to provide money for support of existing and proposed rural transit systems. The objectives of this research was to determine how these systems can be designed so as to be maximally effective in providing transportation service. In working toward this objective, detailed case studies and statistical studies were conducted to relate transit performance with different design factors.

Directory of Information for Dynamometer Testing of 1979-1981 Light Duty Motor Vehicles,
John C. Shelton. Aug 81, 62p EPA-AA-TEB-81-25
See also report dated Oct 80, PB81-207391.

This report contains information for use in dynamometer testing of 1979 through 1981 model year light duty vehicles. The information was originally compiled for use in Emission Factor programs which are conducted by the Test and Evaluation Branch of the Emission Control Technology Division. Emission Factor programs involve testing of large numbers of in-use light-duty trucks and passenger cars at various locations throughout the country. An EPA report 'Index to Emission Factor Testing Programs', EPA-AA-TEB-81-3, contains more information about these programs. The information contained in this document can be used by EPA, independent laboratories, and others who conduct emission tests on passenger cars and light-duty trucks for purposes other than certification. The primary purpose is for laboratories who test vehicles in Emission Factor programs and for evaluation of retrofit devices, including fuel additives, oils and oil additives.

Investigation of Design Standards for Urban Rail Transit Elevated Structures.
Final rept.,
B. W. Harrington, Jr. Jun 81, 49p UMTA-GA-06-0010-81-1
Contract DOT-UT-90013

During the past decade, mass or public transportation has received an increase in attention as a viable transportation mode within highly urbanized areas. This increase in recognition of the mass transit mode of moving people, largely came about as a result of congestion of cars on urban highways and streets. At about the same time as automobile congestion was becoming critical, organized opposition to construction all but stopped cities from relieving their transportation problems. It was these events that prompted urban communities to look at alternate transportation modes, such as elevated rail transit systems. The purpose of this report was to review the various criteria for design of elevated rail transit structures currently in use by selected transit properties and to determine the feasibility of industrywide guidelines for their design, and to compile them in one source.

The Role of an Understanding of Social Factors in Forecasting Car Ownership,
Jean M. Hopkin. c1981, 27p TRRL-SUPPLEMENTARY-695
Also pub. as ISSN-0305-1315. Paper presented to the International Conference on Travel Demand Analysis: Activity-Based and Other New Approaches, held at St. Catherine's College, Oxford, 9-11 July 1981.

This report discusses the possible uses of an understanding of the social factors influencing behavior in forecasting car ownership. Official forecasting techniques employed in the UK are described, and the case for change is reviewed. Particular attention is devoted to the potential for developing models which replicate the process of change in car ownership. Some empirical examples in which an understanding of behavior has been applied to car ownership forecasting are considered. These show the reasons why people give up or acquire cars, and demonstrate the data requirements of this kind of research and the types of statement about the future which can be made. It is concluded that the type of model which reproduces actual behavior fully is likely to be too complex and data-intensive to replace more conventional forecasting techniques completely, although some models might be feasible for particular areas or population groups. However the report shows that an understanding of the social factors influencing behavior

can provide valuable background information for enhancing conventional forecasting models and can also suggest the possible structure of alternative forecasting models. (Copyright (c) Crown Copyright 1981.)

Railroad Yard Simulation Model: Description and Computer Program Users' Manual.
Final rept. Sep 78-Feb 81,
L. E. Wittig, C. E. Waldman, and E. K. Bender. Oct 81, 88p BBN-4606, FRA/ORD-81/25.I
Contract DOT-FR-8091
See also PB81-123556.

This report is part of a larger study to identify potentially cost-effective advanced braking and coupling systems. The report describes a model for determining the cost savings in railroad yards that would result from the implementation of advanced braking and coupling systems. First, the operations of a hypothetical composite yard are explained in terms of logic diagrams. These diagrams are reduced to a set of equations, which, in turn, are incorporated into an interactive computer program. Flow diagrams for the program are included. Several example cases are presented that explain how the user determines which variables should be changed, show how he enters this information into the program, and finally, show how he executes the program.

Final Results of the 'One Week Follow-Up' with Participants during the FY79 and FY80 Emission Factor Testing Programs.
Technical rept.,
Thomas C. Bejma. Aug 81, 42p EPA-AA-TEB-81-27

This paper describes the results of a follow-up survey with participants during the FY79 and FY80 Emission Factor Testing Programs. The surveys were conducted in the form of a questionnaire which program participants were asked to complete and return, about one week after their vehicle was tested and returned to them. The questions pertained to the efficiency of the lab personnel and the performance of their vehicle after it had been tested. Over 70% of the 2500 questionnaires were completed and returned. The results of both surveys show that practically all participants felt they were treated efficiently by the lab personnel and that the vast majority felt that their vehicle displayed either no change or an improvement in its performance. Of those respondents whose vehicles received maintenance, the percentage that felt that there was an improvement in performance was greater than that of the owners of vehicles which did not receive maintenance. Of the respondents who were not satisfied with the present performance of their vehicles after maintenance, both programs indicate that most felt the same before the maintenance and testing had been performed.

Supersedes PB80-813272, and NTIS/PS-79/0800.

Studies are cited on the interaction of an automotive or aircraft tire with a wet pavement resulting in reduced traction, skidding, or complete loss of contact under certain conditions. The discussions cover the composition and surface characteristics of highway and runway pavements, the acquisition or retention of water films on roads during rainfall, skid resistance and antiskid measures, tread engineering, testing and measuring equipment and methodology, critical speeds, wheel spindown, water depth factors, rolling contact loads, and associated topics. (This updated bibliography contains 146 citations, 8 of which are new entries to the previous edition.)

Contract F30602-81-C-0008, ARPA Order-3503

This study investigates the requirements for making ultra-lightweight mirrors of Ultra-Low Expansion (ULE) fused silica by frit bonding. It includes a manufacturing assessment of the facilities needed to scale the mirror technology to 4 meters in diameter. It also includes a front surface flux loading thermal test of a .5M diameter frit bonded ULE mirror. The test was supported by detailed modeling and analysis. (author)

Optimization of Performance of Arc Welding Using Fluxes in Welded Ship Structures from HY-100 and HY-130 KPSI.
Final rept. 1 Feb 75-31 Dec 78,
Clarence E. Hackson, James T. Hickey, and Michael D. Hayes. Sep 81, 72p
Contract N00014-75-C-0666

The ability to weld steels with yield strengths over 100 ksi with the submerged arc process has been limited by a lack of fluxes and filler metals specifically designed for this purpose. This research program used commercially available filler wires that have been designed for gas metal arc welding and formulated flux compositions to limit the oxygen pickup in the weld metal. The effect of flux basicity on weld metal oxygen content was investigated. Experimental results with approximately 100 heats of fused flux indicated a definite trend of decreasing weld metal oxygen content with increasing flux basicity. In these tests the commercial fluxes produced weld metal with adequate toughness but low yield strength. In mechanical testing, the weld metal produced with experimental fluxes showed good tensile properties with inadequate impact values. The coarse microstructure of the last pass in the welds produced with experimental fluxes appears to be made up of untempered martensite, lower bainite, ferrite and proeutectoid ferrite. It is probable that the cracking observed was solidification cracking and may be related to the high phosphorus content of the weld metal. Additions of vanadium and molybdenum in the electrode or as oxides in the high purity flux may be effective in improving toughness.

NASA-CR-161892
Contract NAS8-32920

The relative values of thermal conductivity of solid and liquid HgCdTe are critically important in the design configuration of the furnaces used for Bridgman crystal growth. The thermal diffusivity of the material is closely linked to the conductivity by the defining relation D = k/rho c, where D is the diffusivity, K is the thermal conductivity, rho is the density, and c is the specific heat. The use of transient and periodic heating approaches to measure the diffusivity are explored. A system for securing and extracting heat from silica or glass tubes under high C vacuum conditions is described.

The main objectives of this study were to explore and develop general-purpose, cost-effective techniques and hardware/software modules for computer controlled systems of manipulators, sensors, and other components that are flexible, adaptable, and easily trained to perform material handling, inspection, and assembly tasks and to transfer this information to industry. Four principal topics were examined: (1) an assembly system in which techniques are developed and demonstrated; (2) computerized visual servoing--involves a vertical bar of light projected on a workpiece to visually servo a manipulator along an edge or a groove of the workpiece; (3) module development--includes an Unimate Manipulator Module, scalar and matrix multipliers, and a Vision Module; and (4) Robot Programming Language (RPL)--an interpreted Fortran-like user language to facilitate the writing and debugging of application programs on a PDP-11/40 minicomputer for material-handling, inspection, and assembly tasks. The appendices include an error analysis of a measured BLOB ;connecting region) centroid; commands for external control of the vision module, and current RPL routines.

Sheet Metal Joining: Nonferrous Alloys. 1972-1981 (Citations from the International Aerospace Abstracts Data Base).
Rept. for Jan 72-Dec 81.
Dec 81, 129p
Prepared in cooperation with the National Aeronautics and Space Administration, Washington, DC.

The bibliography cites reports relating to joint analysis and joining techniques of nonferrous thin plates and sheets. Extensively covered are the aluminum and titanium aerospace alloys. Included also are joining methods for magnesium, beryllium, copper, refractory, and composite alloy sheets and plates. Welding, adhesive bonding, tensile strength testing, fracture mechanics, distortion control, residual stress measurement, and post weld heat treatment of nonferrous

metal plates and sheets are considered. (Contains 125 citations fully indexed and including a title list.)

Design Analysis for the Control and Drive Retrofit of a Numerically Controlled Lathe.
S. L. Cotter. 1980, 10p CONF-800606-1
Contract W-7405-ENG-36
Symposium on incremental motion control systems and devices, Champaign, IL, USA, 2 Jun 1980.

A system approach to the retrofit of a numerically controlled two-axis lathe was taken to identify component function and interrelation. The dynamic system of the motor and machine was modeled and parameter identification experiments were done. This model, in state equation form, was used with the parameters data as the basis of a digital simulation of the system. From this and further analysis of the control characteristics, recommendations for component selection were presented. (ERA citation 05:022775)

Gas Levitator and Method for Containerless Processing.
Patent Application,
L. H. Berge, W. A. Oran, and J. M. Theiss. Filed 28 Aug 81, 17p N82-10359/9, NASA-CASE-MFS-25509-1
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

An elongated levitation tube having a contoured interior in the form of a convergent section, and a constriction and divergent section, wherein the levitation node is created, is described. Gas flow control means control flow to prevent separation of flow from the interior walls in the region of specimen. An apparatus provides for levitating and heating the specimen simultaneously by combustion of a suitable gas mixture combined with an inert gas.

Monitoring of Machines,
M. Gaillochet. 1981, 44p CETIM-15-J-041-PT-2
Trans. of mono. Surveillance des Machines, n.p., n.d. See also French version N81-24480/8.

The application of classical vibration analysis to the surveillance of the mechanical condition of machines is described. Automated procedures handled by specialized computers, using advanced signal processing techniques, are sought. Vibration measurement and analysis are reviewed, covering sensors and recorders, frequency analyzers, and methods for visualization results. Existing procedures for monitoring machine wear are touched on. A method for determining vibration signatures is proposed. As an example, the vibrations generated by reduction box elements are characterized. A low frequency Fourier analysis is performed. The individual signatures of the gear wheels are identified. A statistical analysis of the global signal is then given. The implications of vibration analysis as a maintenance tool are brought out, emphasizing the advantages to be accrued through automation of wear diagnostics.

Logistics Concerns over Navy's Guided Missile Frigate FFG-Class.
7 Jul 81, 62p Rept no. GAO/PLRD-81-34
Report to the Congress.

The Navy has developed many logistics strategies for the FFG-7 class ships, which differ significantly from traditional practices in the surface Navy. It wants to reduce the number of shipboard personnel needed and increase ship availability. Questions remain, however, as to whether this will provide adequate and economical logistics support for the FFG-7s. This report raises a number of issues about the feasibility and economy of the new logistics strategies and recommends actions to improve support.

Advanced Superposition Methods for High Speed Turbopump Vibration Analysis.
Interim Report.
C. E. Nielson, and A. D. Campany. 19 May 81, 96p
NASA-CR-165379, RI/RD81-149
Contract NAS3-22480

The small, high pressure Mark 48 liquid hydrogen turbopump was analyzed and dynamically tested to determine the cause of high speed vibration at an operating speed of 92,400 rpm. This approaches the design point operating speed of 95,000 rpm. The initial dynamic analysis in the design stage and subsequent further analysis of the rotor only dynamics failed to predict the vibration characteristics found during testing. An advanced procedure for dynamics analysis was used in this investigation. The procedure involves developing accurate dynamic models of the rotor assembly and casing assembly by finite element analysis. The dynamically instrumented assemblies are independently rap tested to verify the analytical models. The verified models are then combined by modal superposition techniques to develop a completed turbopump model where dynamic characteristics are determined. The results of the dynamic testing and analysis obtained are presented and methods of moving the high speed vibration characteristics to speeds above the operating range are recommended. Recommendations for use of these advanced dynamic analysis procedures during initial design phases are given.

Liquid Oxygen Turbopump Technology.
Final Report.
C. E. Nielson. Nov 81, 252p NASA-CR-165487, RI/RD81-199
Contract NAS3-21356

A small, high-pressure, LOX turbopump was designed, fabricated and tested. The pump is a single-stage centrifugal type with power to the pump supplied by a single-stage partial-admission axial-impulse turbine. Design conditions included an operating speed of 7330 rad/s (70,000 rpm), pump discharge pressure of 2977 N/sqcm (4318 psia), and a pump flowrate of 16.4 Kg/s (36.21 lb/s). The turbopump contains a self-compensating axial thrust balance piston to eliminate axial thrust loads on the bearings during steady-state operation. Testing of the turbopump was achieved usng a gaseous hydrogen high-pressure flow to drive the turbine, which generally is propolled by LOX/LH2 combustion products, at 1041K (1874 R) inlet temperature and at a design pressure ratio of 1.424. Test data obtained with the turbopump are presented which include head-flow-efficiency performance, suction performance, balance piston performance and LOX seal performance. Mechanical performance of the turbopump is also discussed.

Improved Constant-Output Atomizer.
Patent Application,
J. Y. Dea. Filed 2 Oct 81, 12p N82-10360/7, NASA-CASE-MFS-25631-1
Sponsored by NASA.
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A constant-output atomizer is described which includes a generally frustoconical expansion nozzle for producing an air jet. A liquid feed line supplies liquid to be atomized by the air jet, and the body includes a groove which opens into the diffuser section of the nozzle downstream of the throat for conducting liquid from the feed line to the nozzle. The groove extends in a direction perpendicular radially to the axis of the nozzle, and it has a depth approximately equal to half the axial length of the nozzle. Liquid, conducted by capillary action in the groove to the nozzle, is atomized into a fine mist by the air jet in the nozzle; and the groove eliminates fluctuations in spray order.

Windshield Damage and Driving Safety.
Final rept. Jul 80-Jun 81,
Paul Green, and William T. Burgess. Jun 81, 66p
UM-HSRI-81-35
Sponsored in part by Auto Glass Industry Committee for Highway Safety, Washington, DC.

In a two-choice response time experiment, drivers viewed slides of nighttime road scenes through four different windshields. Drivers were asked to indicate if it was 'safe to proceed' by pressing buttons. Increasing the degree of windshield damage led to increases in response time, especially when a light simulating the glare of an oncoming vehicle's headlamps was present. This last result suggests to the authors that windshield damage is a visibility problem that should receive more attention from drivers and safety organizations.

Yellow Bar Experimental Carriageway Markings - Accident Study,
R. D. Helliar-Symons. c1981, 22p TRRL-LR-1010
Also pub. as ISSN-0305-1293.

Analysis of accidents at 42 roundabouts at which Yellow Bar experimental carriageway markings had been laid on an approach road, showed an overall reduction in the proportion of speed-related accidents on these approach roads of 57 per cent. The markings appeared to be most effective in reducing fatal and serious injury accidents, while still reducing slight injury accidents. They were more effective in daylight than after dark and appeared to be most effective when the road surface was wet, rather than dry. They were highly cost-beneficial and the accident reduction was maintained at seven pilot sites for which data for four years after installation were available. (Copyright (c) Crown Copyright 1981.)

Finite Element Techniques for Static Stress and Free Vibration Analysis of Sandwich Composites.
Final rept. Sep 77-Nov 80,
Robert A. Brockman. Mar 81, 63p UDR-TR-80-134, AFWAL-TR-81-3007
Contract F33615-77-C-3075

Finite element solution techniques for stress and vibration analysis of layered sandwich panels are presented. The modeling approach considers each layer of the sandwich explicitly and can treat panels involving discrete stiffeners of two types. Static analyses of general sandwich panels can include mechanical and/or thermally-induced forces. Free vibration analysis is also considered. The associated computer program is suitable for operation at an interactive terminal, and includes provisions for automatic mesh generation and tabular output. Generated input and output data are in a form which may be accessed by existing computer graphics programs for plotting geometry and results. Sample analyses are presented to demonstrate the developed techniques. (Author)

Minimum Weight Design of Flat Sandwich Panels under Edgewise Compression Loads.
Final rept. Sep 77-Nov 80,
Fred K. Bogner, and M. L. Soni. Mar 81, 56p UDR-TR-80-119, AFWAL-TR-81-3009
Contract F33615-77-C-3075

An approach to the optimum design of flat, rectangular sandwich panels subjected to edgewise compression loading has been developed. Using a nonlinear programming method called the Sequential Unconstrained Minimization Technique, the design parameters characteristic of sandwich construction are determined so that the final panel configuration is not just an acceptable design, but is the best acceptable design as far as total panel weight is concerned. The design parameters are the individual thicknesses of the top and bottom face sheets and of the core, the cell size and foil thickness of honeycomb core, and the density of foam core. The acceptable ranges of the design parameters are limited by constraints which ensure, for example, that the thicknesses are within minimum and maximum limits, that the faces do not yield, wrinkle, or dimple, and that the panel does not buckle. Possible panel loads are edgewise compression in two directions.

Cold Regions Research and Engineering Lab., Hanover, NH.
Cold Regions Testing of an Air-Transportable Shelter,
Stephen N. Flanders. Aug 81, 28p Rept no. CRREL-81-16

An air-transportable shelter designed and built at CRREL for use in cold regions underwent testing in Hanover, New Hampshire, and Ft. Greely, Alaska. The shelter demonstrated some of its capabilities for mobility by being towed for more than 60 miles behind various vehicles and by being transported on a C-130 cargo airplane, a CH-47 helicopter, and a trailer truck. The shelter proved to be very easy for a crew of two to four to set up in all weather conditions including -40 F cold. However, the gasoline-powered generator, which was a source for space heat as well as electricity, functioned very poorly. Overall, the prototype successfully demonstrated qualities of self-reliance, ease of operation and thermal efficiency. (Author)

Conference on thermal performance of the exterior envelopes of buildings, Orlando, FL, USA, 3 Dec 1979.

A new device is proposed for measuring the thermal resistance and the dynamic thermal response of building walls in either the laboratory or the field. The primary departures from past approaches are the control of the time-dependent surface heat fluxes on the specimen and the determination of the surface temperatures as dependent variables. The performance characteristics of the device are analyzed by the use of complex thermal admittance. A prototype is being developed based on this analysis. The apparatus is portable and has sophisticated on-line computer control and data analysis through the use of a microprocessor. (ERA citation 05:032439)

Air Exchange Measurements in a High Rise Office Building.
Final rept.,
C. M. Hunt, and S. J. Treado. 1981, 18p
Pub. in Proceedings of ASHRAE/DOE/ORNL Conference on Thermal Performance of Exterior Envelope of Buildings, Orlando, Florida, December 3-5, 1979, ASHRAE SP 28, p160-177 1981.

Air exchange rates were measured in the tower of an 11-story office building using SF6 as a tracer gas. Fall and winter air exchange rates, I (hr to the minus 1), measured with make-up and main exhaust pathways blocked, could be represented as a function of wind spread, W (mi/hr), by the equation I = 1.08 + 0.036W - 0.0005W squared, sigma = 0.15. Wind direction and temperature difference (stack effect) exerted little effect on air exchange rate. In this building, toilet exhausts and other weather-independent mechanisms were more important than natural infiltration in producing air exchange. Inside-outside pressure difference measurements were monitored as a function of temperature and wind speed. Also, a preliminary analysis of predicted air infiltration by the Shaw-Tamura model was undertaken. The results of this preliminary analysis were consistent with the observations that the stack effect was unimportant and that natural infiltration contributed only part of the total air exchange. However, the plot of calculated infiltration rate as a function of wind speed, using the Shaw-Tamura model, had a different form than the plot of measured data.

Model Noise Control Provisions for Building Codes and an Implementation Manual,
A. S. Harris, D. S. Keast, N. P. Miller, and T. J. Schultz. Aug 81, 105p EPA-550/9-81-401

A model municipal noise control code for buildings has been developed. Also included is an implementation manual for this code. The provisions of the code were developed with three objectives in mind. First, they attempt to minimize the adverse health and welfare effects of intruding noise without requiring the construction of economically unreasonable buildings. Proposed standards for the outdoor reduction of noise levels are achievable with existing materials and construction techniques. Secondly, enforcement for the review of plans and for the acceptance of completed buildings are described. Thirdly, this material should help jurisdictions develop a process of administration and enforcement that is compatible with existing building code procedures. The model provisions of the proposed building code contain performance standards. These standards are administered and enforced by review of plans and inspections during and after construction of buildings.

Probabilistic Analysis of Seismic Response of Multi-Supported Structures on Soft Soils (Analisis Probabilistico de la Respuesta Sismica de Estructuras Sobre Varios Apoyos en Suelos Blandos),
Sonia Ruiz, and Luis Esteva. Dec 80, 39p 432
Text in Spanish.

A probabilistic analysis criterion is presented to estimate seismic response of multi-supported structures on soft soil subjected to out-of-phase ground motion. The criterion is based on the proportionality between the design response and the standard deviations of that response. The ground motion is represented as the product of a stationary gaussian stochastic process and a deterministic intensity function of time. As an example the expected maximum relative displacements of a multi-supported bridge with piles embedded in a soft clay stratum subjected to SV seismic waves were computed.

Design of Concrete Walls with Shear Failure (Diseno de Muros de Concreto Con Falla Por Cortante),
Oscar Hernandex Basilio. Dec 80, 178p 433
Text in Spanish.

As a result of an experimental program the hysteretic behavior of concrete walls with shear failure is discussed and a method for the prediction of shear wall strength is proposed. The method takes into account several variables whose effect had not been sufficiently studied. Calculated strength is compared with the results of shear wall tests carried out in different research programs and an excellent approximation is found. Also, step by step analyses under actual earthquakes were carried out in order to show the behavior of the model which described the hysteresis loops under lateral loads of concrete walls under high shear forces.

Documentation of Program for Determination of Conduction Transfer Functions,
Bradley A. Peavy. Nov 81, 50p NBSIR-81-2353

Conduction transfer functions are used to predict the time-dependent one-dimensional conduction heat transfer at surfaces of single- or multi-layer building constructions based on heat flux and temperature history at each surface. By the use of conduction transfer functions, heat transfer problems employing nonlinear boundary conditions such as thermal radiation and time-dependent changes in the surface film resistances can be solved. Because conduction transfer functions are analytically derived with an initial time condition of zero temperature potential throughout the solid materials, it becomes necessary to initialize the computation by including exposure to a number of outdoor weather cycles such that satisfactory initial conditions of temperature and heat flux exist at the inside and outside surfaces. The program is set up for the use of 1-, 2-, or 3-hour time intervals, depending on the thickness of the building construction. The program allows for the combination of two building constructions, e.g., the parallel heat flow paths found in wood-frame walls.

Development and Field Verification of a Model of House Air Infiltration for Single Family Residences.
Final rept. Jul 80-Jun 81,
James T. Cole, John A. Kinast, Thomas S. Zawacki, Robert H. Elkins, and Robert A. Macriss. Jul 81, 79p GRI-80/0082
Contract GRI-5080-341-0320

An air infiltration computer program, developed earlier, has been further refined by the inclusion of the effects of door openings and vent-fan usage on house air infiltration. The model has also been further verified for its accuracy and precision by comparison to actual air infiltration data from both 'conventional' construction dwellings and also from two 'advance' design homes. A program listing and user manual of the computer program have also been developed. A simplified computer program has been developed for the use of the model to estimate house air infiltration by means of a hand-held programmable calculator. Also, a rigorous air infiltration-load computer program, has been developed capable of integration into existing programs for building energy calculations, such as E-Cube, NBS-LD, DOE-2, etc.

Aug 79, 121p HUD-0002035
Contract HUD-H-5180
Sponsored in part by National Research Council, Washington, DC. Building Research Advisory Board.

This volume contains the proceedings of a joint seminar attended by representatives of the United States and the USSR, on building electrical, plumbing, and heating / ventilating / air conditioning systems. Full texts of six papers and accompanying discussions from the bilateral working group on internal utilities are presented. This state - of - the - art material is intended to serve as a foundation for further study under technical information exchange agreements as well as a resource for American specialists working in the research and application of improved utilities technology. Papers presented by U.S. representatives focus on the current practice for design and installation of building electrical systems; conservation of water in buildings; and design, fabrication, and control of heating / ventilating / air conditioning systems. Representatives of the Soviet Union presented papers on building sewage systems, single - pipe heating and potable water supply systems, and physical modeling of ventilating and air conditioning systems. Photographs, graphic illustrations, and tabular data are included.

Fire Endurance Under Design Load for Walls of One-Story Three-Room Structures of Sandwich and Wood-Frame Construction,
Herbert W. Eickner, Carlton A. Holmes, John J. Brenden, Curtis C. Peters, and Robert H. White. Feb 81, 92p HUD-0002069

Large - scale fire tests were conducted on seven wooden structures to examine the actual endurance times of structural sandwich walls in housing under design loads when exposed to interior fires and to compare endurance times with those for conventional wood - frame structures. Additional study goals were to determine the influence of interior thermal protection and to correlate performances to laboratory results. The seven structures were 16 feet by 24 feet. Four of the structures were of sandwich construction with cores of plastic or paper honeycomb, and three structures were of wood - frame construction. The walls were loaded to a computed design loading. Fire endurance was determined under a fire exposure from a typical building contents loading of 4.5 pounds per square foot of floor area. Two open windows at each end of each structure were wized to obtain a ventilation - controlled fire during the fully developed test. the tests confirmed the poor fire endurance performance of the unprotected sandwich construction as previously indicated by laboratory tests. Interior thermal protection in the form of gypsum wallboard improved the performance of sandwich and wood - frame walls. For fire endurance, conventional wood - frame construction appeared to be better than load - bearing sandwich panels with plywood faces. The tests also showed that 640 degrees was a critical temperature associated with flashover under the fire conditions used. During the early stages of some of the structure tests, the optical density of the fire atmosphere seemed to vary linearly with time. Chemical analysis showed little evidence of hydrogen cyanide accumulation, although this compound could be a degradation product of some of the sandwich panels. The carbon monoxide and carbon dioxide concentrations were consistent with the test structures' geometry, outside weather conditions, and overall stage of fire growth at the time of measurement. A reference list and an appendix presenting photographs, figures, and tables with study results are provided. (Author abstract modified).

New Approaches to Evaluating Firesafety in Buildings: Proceedings of a Conference, September 20-21, 1978, Washington, DC.
Symposium-workshop rept. no. 5.
Jul 80, 248p ISBN-0-309-03089-7
Contract EO-A01-78-00-3531
Library of Congress catalog card no. 80-52473.

A conference was organized on 'New Approaches to Evaluating Firesafety in Building', with the joint sponsorship of the National Fire Prevention and Control Administration and the Construction Research Council, to provide a broad audience representative of the building community with a better understanding of the developmental status of systems approaches and their application to firesafety. The purpose of this report is to present the proceedings of the conference. The first portion of the two day conference was devoted to description of the four basic approaches to the systems concept that have been or are being developed and their actual application. These papers are presented in Part I of this report. During the second portion of the conference, the potential impact of systems applications was discussed. Five panels composed of representatives of those groups that would be most affected by such applications (i.e., owners and managers, designers, insurers, codes and standards groups, and educators and trainers) led the discussion and the presentations of these panelists are presented in Part II of this report. A list of those participating in the conference is presented in the Appendix.

Automatic Microwave Network Analyzer Calibration by Reference to a Transmission-Line Standard with Applications to Characterization of Adapters, Devices, and Coaxial Lines with SMA Connectors.
Doctoral thesis,
Joseph Peter DiBeneditto. Oct 81, 188p Rept no. AFIT-CI-81-12D

This dissertation describes the development of new techniques for calibrating a microwave automatic network analyzer (hereafter ANA) for complex reflection measurements. These techniques promise significant advantages for miniature connector systems. They include the use of an experimentally-derived characterization of an APC-7 open-circuit termination as a high-reflection calibration standard, adapter correction based on low dissipative losses, and a length of transmission line instead of a sliding load or fixed termination as a low-reflection standard. Gains afforded by these new techniques are reduced operator intervention during calibration, less wear of the measurement port connectors, lower equipment and maintenance costs, and calibrations referenced to standards truly

relevant to the interconnecting transmission medium. Computer memory requirements are increased, but the cost of the increase is insignificant compared to the cost of microwave instrumentation. Slightly longer calibration times are offset by reduced demands upon operator skill. Methods of extending these calibration techniques to full two-port measurements will be discussed. (Author)

Laser Photoacoustic Technique for NDE.
Final rept. 16 Aug 78-15 Aug 81,
R. L. Thomas. 26 Oct 81, 6p ARO-15746.14-MS
Contract DAAG29-79-C-0151, Grant DAAG29-78-G-0182

The physics of the scanning photoacoustic microscopy (SPAM) has been developed. SPAM has been applied to NDE problems in high performance ceramics, and has been shown to be potentially useful for NDE in other solids, such as metals and semiconductors. One of the most important problems in nondestructive evaluation (NDE) has been that of detecting small (10 micron - 100 micron) flaws which lie just beneath the surface of an opaque solid. This problem is particularly acute for the technologically important, but brittle, ceramic materials, SiC and Si3N4. The objective of this program was to investigate and develop an entirely new NDE experimental technique, which we have named scanning photoacoustic microscopy (SPAM), and to test its applicability for subsurface NDE of ceramics.

Seismic Isolation of an Electron Microscope.
W. G. Godden, M. Aslam, and D. T. Scalise. Jan 80, 11p CONF-800919-3
Contract W-7405-ENG-48
World conference on earthquake engineering, Istanbul, Turkey, 8 Sep 1980.

A unique two-stage dynamic-isolation problem is presented by the conflicting design requirements for the foundations of an electron microscope in a seismic region. Under normal operational conditions the microscope must be isolated from ambient ground noise; this creates a system extremely vulnerable to seismic ground motions. Under earthquake loading the internal equipment forces must be limited to prevent damage or collapse. An analysis of the proposed design solution is presented. This study was motivated by the 1.5 MeV High Voltage Electron Microscope (HVEM) to be installed at the Lawrence Berkeley Laboratory (LBL) located near the Hayward Fault in California. An Algorithm for Minimum-Cost Set-Point Ordering in a Cryogenic Wind Tunnel.
J. S. Tripp. Nov 81, 32p NASA-TP-1923, L-14695

An algorithm for minimum cost ordering of set points in a cryogenic wind tunnel is developed. The procedure generates a matrix of dynamic state transition costs, which is evaluated by means of a single-volume lumped model of the cryogenic wind tunnel and the use of some idealized minimum-costs, which is evaluated by means of a single-volume lumped model of the cryogenic wind tunnel and the use of some idealized minimum-cost state-transition control strategies. A branch and bound algorithm is employed to determine the least costly sequence of state transitions from the transition-cost matrix. Some numerical results based on data for the National Transonic Facility are presented which show a strong preference for state transitions that consume to coolant. Results also show that the choice of the terminal set point in an open odering can produce a wide variation in total cost.

Magnetic Field Investigation for ISEE Mother and Daughter Spacecraft.
Final Report.
C. T. Russell. 7 Jun 81, 4p NASA-CR-166713
Contract NAS5-20064

Highlights of the design and fabrication of fluxgate magnetometers for the ISEE A and B satellites which were launched from a single launch vehicle into the same highly elliptical orbit are presented. The instrument consisted of four basic assemblies: the sensors, the drive and sense electronics, the data handling unit; and the flipper. The digital handling data handling assembly contained a digital filter that mantained a uniform transfer function for all three axes of both spacecraft. Initial studies centered on the bow shock and the magnetopause and show that both boundaries are in rapid motion. The bow shock was found to be very thin, close to an ion inertial length in thickness, but the magnetopause was much thicker than expected, about 400 to 1000 km on average. The magnetometers have each logged over 3 2/3 years of continuous operation.

Far-Infrared Measurements of Trace Gases.
Final Technical Report.
I. G. Nolt, and J. V. Radostitz. Sep 80, 6p NASA-CR-164965
Grant NSG-7360

A better detector system was developed for far infrared spectroscopy by usng cryogenic technology to cool bolometric detectors to approximately 0.4K. Technical assistance was provided to two submillimeter infrared balloon experiment (SIBEX) flights which demonstrated the diagnostic capability of far IR emission spectroscopy. It is estimated that more than a hundred spectral emission features were detected which are not due to the main emitting gases O3, O2, and H2O. The trace species sources for many features still remain unidentified and the spectra obtained during the SIBEX flights present a new source of information on stratospheric composition.

Digital Ultrasonics Signal Processing: Flaw Data Post Processing Use and Description.
Final Report.
V. E. Buel. 30 Sep 81, 141p NASA-CR-161882
Contract NAS8-33100

A modular system composed of two sets of tasks which interprets the flaw data and allows compensation of the data due to transducer characteristics is described. The hardware configuration consists of two main units. A DEC LSI-11 processor running under the RT-11 single job, version 2C-02 operating system, controls the scanner hardware and the ultrasonic unit. A DEC PDP-11/45 processor also running under the RT-11, version 2C-02, operating system, stores, processes and displays the flaw data. The software developed the Ultrasonics Evaluation System, is divided into two catagories; transducer characterization and flaw classification. Each category is divided further into two

functional tasks: a data acquisition and a postprocessor ask. The flaw characterization collects data, compresses its, and writes it to a disk file. The data is then processed by the flaw classification postprocessing task. The use and operation of a flaw data postprocessor is described.

Inductively Coupled Plasma-Atomic Emission Spectrometric Analysis of Environmental Samples Using Ultrasonic Nebulization.
Journal article,
Charles E. Taylor, and Terrance L. Floyd. 5 Jan 81, 8p EPA-600/J-80-044
Pub. in Applied Spectroscopy, v35 n4 p408-413 1981.

Ultrasonic and pneumatic nebulizers used in inductively coupled plasma-atomic emission spectrometry (ICP-AES) are compared in the analysis of standard materials and environmental samples. Results verify that ICP-AES with ultrasonic nebulization is capable of lower detection limits than ICP-AES with a pneumatic system. The ultrasonic system used with desolvation, therefore, is the more desirable system when ultra-trace ICP-AES quantitative analyses are required in a variety of environmental samples.

Terrestrial Solar Simulators for Photovoltaic and Combined Photovoltaic and Thermal Device Measurement and Evaluation.
Final rept.,
S. Patrick, and R. Giuntini. Oct 80, 50p WR-80-34, NBS/GCR-80-279
Contract NB79-SBCA-0079
Sponsored in part by Solar Energy Research Inst., Golden, CO.

The use of terrestrial solar simulators used for testing photovoltaic and combined photovoltaic/thermal devices by a representative cross section of the photovoltaics community is reviewed. Measurements-related needs identified by this comaunity are also reviewed. Among the needs identified are major improvements in the area of standardized test and calibration procedures. Also identified is the need for a source dedicated to providing reference cells to the photovoltaics community and for workshops to address measurements-related problems and developments. Included are tables that review the type and use of terrestrial solar simulators used and that list data-sheet information about these simulators.

Modification of a Commercial Atomic Absorption Spectrophotometer for Cold-Vapor Determination of Mercury.
Rept. of investigations,
Jospeh A. Perry, Raymond F. Farrell, and Alick J. Mackie. Oct 81, 17p BUMINES-RI-8573
Library of Congress catalog card no. 81-607897.

One goal of the Bureau of Mines is to develop technology to insure a dependable supply of minerals to the United States. To support this goal, the Bureau's Albany Research Center has modified a commercial atomic absorption spectrophotometer to rapidly determine trace levels of mercury by cold-vapor atomic absorption spectrophotometry. Such diverse materials as ores, mill products, stream water, sediments, and flue dust have been analyzed. A very high dynamic range of 0.2 ng/ml to 1 microgram/ml of mercury in solutions is routinely analyzed by this instrument.

Development of Fuel Cell Gas Detection Instruments for Use in a Mine Atmosphere.
Open file rept. (Final) Sep 77-Mar 79,
J. A. Kosek, A. B. LaConti, A. Goldstein, G. Schnakenberg, and E. Chilton. Mar 79, 132p BUMINES-OFR-164-81
Contract H0357078

The objective of this report was to develop instruments for detecting CO, NO, and NO2 in a mine atmosphere using fuel cell technology. The approach was to optimize the fuel cell sensor configuration for the specific detection of CO, NO, and NO2 in the presence of other mine gases utilizing recent advances in catalyst, electrode, and solid polymer electrolyte membrane technology. Parametric testing was conducted on three electrode sensor cells to define performance and life characteristics as a function of temperature, feed flow, and applied sensor voltage. Extended life testing was performed on sensor cell configurations exhibiting favorable characteristics. Reliable, efficient gas sampling and electronic control circuitry was fabricated for use with the sensor cells and integrated into devices to meet the performance and design specifications for portable, battery-operated, hand-held direct-indicating gas detectors for use underground.

Acoustic Model Power Distribution in a Duct at High Frequencies.
Technical rept.,
S. M. Baxter. Apr 81, 42p ISVR-TR-111

The work described in this report represents part of a project undertaken with the National Gas Turbine Establishment (N.G.T.E.). The project is an experimental and theoretical investigation of the distribution of acoustic power among the modes of an acoustic duct. The duct forms part of an absorber test facility. The experiment is intended to test an assumption currently used in interpreting data from the facility, namely that the sound power in the duct is equally distributed among the propagating acoustic modes. The report is essentially a progress report, and covers the theoretical basis for the measurement technique. At the time of writing the experiment and its analysis are not complete. Section 2 of the report provides a brief description of the experiment and its motivation. Sections 3-5 present the theory, and Section 6 is a summary.

High Concentration Dust Monitor.
Open file rept. (Final) 28 Dec 79-29 May 81,
Pedro Lilienfeld. Jun 81, 77p BUMINES-OFR-159-81
Contract H0308010

The objective of this investigation was the development, design, fabrication, and testing of a portable, self-contained prototype monitoring instrument capable of detecting and measuring airborne coal dust levels as concentrations in the range of 20 to 500 g/cu m. The output of the high concentration dust monitor is essentially independent of particle size and composition, with a response time of 10 seconds. Direct concentration readout as well as internal memory or recording capabilities are incorporated in the device. The operation of the instrument is based on direct sensing of the mass concentration of airborne dust by air-path beta radiation attenuation. The monitor is battery operated and incorporates a microprocessor that controls periodic automatic zero referencing, executes the mass computations, records the data for subsequent playback, and performs internal diagnostic checks. The design emphasizes ruggedness, simplicity of operation, and adherence to intrinsic safety requirements.

A Transient Hot Wire Thermal Conductivity Apparatus for Fluids,
Hans M. Roder. 26 May 81, 37p
Contract NASA-C-32369-C
Sponsored in part by National Aeronautics and Space Administration, Washington, DC.
Included in Jnl. of Research of the National Bureau of Standards, v86 n5 p457-493, Sep-Oct 81.

A new apparatus for measuring the thermal conductivity of fluids is described. This is an absolute method utilizing a transient hot wire. Measurements are made with a 12.7 micrometers diameter platinum wire at real times of up to 1 second. The data acquisition system includes a minicomputer and a digital voltmeter. The experimental core of the system incorporates a compensating hot wire in a Wheatstone bridge circuit. The cell containing the core of the apparatus is designed to accommodate pressures from 0 to 70 MPa and temperatures from 70 to 320 K. Oxygen was measured over a wide range of physical states including the dilute gas, the moderately dense gas, the near critical region, the compressed liquid states, and the vapor at temperatures below the critical temperature. Performance checks of the apparatus were conducted with nitrogen, helium and argon. Measurement of rare gases allows a direct comparison to the kinetic theory of gases through the viscosity. A second check looks at the variation of the measured thermal conductivity as a function of the applied power. The precision (2 sigma) of the new system is between 0.5 and 0.8 percent for wire temperature transients of 4 to 5 K, while the accuracy is estimated at around 1.5 percent.

Determination of the Relationship between Information Capacity and Identification by Simulated Aerial Photography.
Master's thesis,
Michael R. Jones. 27 Jun 78, 47p Rept no. AFIT-CI-79-252T

The relationship between information capacity and the ability of photointerpreters to identify vehicles in simulated aerial reconnaissance was investigated. An aerial scene lighting simulator was constructed and used in the production of a series of simulated aerial reconnaissance photographs of models of military tanks and trucks. The information capacity of these photos was varied by defocussing the taking camera and the simulated ground scale was varied by changing the taking camera reduction. Duplicate positives of these images were evaluated by trained military photointerpreters who determined the resolving power and attempted to identify the vehicles from a key provided. The resulting empirical probability of correct identification for each vehicle was plotted against the information capacity, which was computed as one half the square of the resolving power. For a probability of correct identification of 0.80, these curves indicate that an information capacity of 7.4 bits per square meter on the ground is required to identify tanks, and 2 bits per square meter is required for identification of trucks.

Survivability--The Effort and the Payoff.
Final rept.,
Eugene Ehrlich, and G. Leslie Geiger. Jun 81, 47p Rept no. R-81-8

This monograph assesses the value of protective construction and attempts to clarify the question of its cost-effectiveness as it affects the engineer battalion. By reviewing the work of others, it shows that protective construction is effective, both historically and analytically. It also provides an estimate of effort required for minimum level of protective construction, draws conclusions relative to its cost benefit, shows that it has a high payoff, and hopefully provides for better decisions as to how much engineer effort can and should be diverted to survivability. Proposed New Handbook for the Federal Emergency Management Agency: Radiation Safety in Shelters.
C. M. Haaland. Sep 81, 143p ORNL-5766
Contract W-7405-ENG-26

This handbook is proposed to replace the portion of the current Handbook for Radiological Monitoring that deals with protection of people in shelters from radiation from fallout resulting from nuclear war. Basic information at a high-school level is given on how to detect nuclear radiation, how to find and improve the safest places in a shelter, the necessity for and how to keep records on individual radiation exposures, and how to minimize exposures. Several new procedures are introduced, some of which are based more on theoretical considerations than on actual experiments. These procedures include: the method of time-averaging radiation readings taken with one instrument in different locations of a large shelter while fallout is coming down and radiation levels are climbing too rapidly for direct comparison of readings to determine the safest location; the method of using one's body to obtain directionality in radiation readings taken with a standard Civil Defense Survey meter; the method of using mutual shielding to reduce the average radiation exposure to shelter occupants; and the ratio method for estimating radiation levels in hazardous areas. Depot Support of Gas Turbine Engines.
Final rept.,
T. J. O'Malley, and David V. Glass. Oct 81, 39p Rept no. LMI-ML103
Contract MDA903-81-C-0166

This report assesses the DoD's capacity and capability to support the depot maintenance requirements of gas turbine engines over the next 5-10 years. Special attention is given to newer nonaeronautical applications (tanks, marine propulsion, and cruise missile). Gas turbine engines used in fixed and rotary wing aircraft will continue to dominate the engine workload; the gas turbines used in cruise missiles, tanks, and ships will comprise less than 10 percent of the total engine workload by 1990. Additional depot maintenance capacity to support gas turbine engines is not required. The depots have adequate capacity today, and since the gas turbine workload is projected to increase by only 6 percent between FY 82 and FY 87, capacity should remain adequate through the 1980s. The Military Departments have the required capabilities to support the new nonaeronautical gas turbine engines entering the DoD inventory. They have repaired similar engines, both in size and technology, for several years. (Author)

Joining the Defense Directives and Defense Acquisition Regulatory Systems,
Alvin W. Platt, and David M. Conrad. May 79, 14p Rept no. LMI-RE902
Contract MDA903-77-C-0370

The Defense Acquisition Regulatory System (DAR System) provides detailed regulations governing Department of Defense (DoD) acquisition of supplies and services. The DoD Directives System provides overall DoD-level instructions, direction and policy on any subject. All acquisition policies and directions contained in directives and instructions issued under the DoD Directives System should be implemented in the DAR. The purpose of this study was to determine how effectively the DAR and the DoD Directive System are or can be joined. The findings indicate that there are no serious impediments to joining the two systems. Directives and instructions sometimes contain language affecting acquisition which often is not incorporated into the DAR. Differing interpretations of the scope of the acquisition process create some difficulty in identifying specific acquisition related issuances. The DoD Directives System does not assign the subject 'acquisition' to any specified numerical sequence. It is recommended that the definition of acquisition in the pending draft revision to the DAR be used universally. The DAR should incorporate all acquisition material now appearing in directives and instructions into a new 'policy' section and become the complete set of regulations governing acquisition policy and procedures. In addition, coordination procedures for review of new directives and instructions should be tightened within OUSDRE so that a positive indication of any impact on the DAR is documented during the coordination cycle of such directives and instructions.

The Navy Must Improve Its Accountability for Conventional Ammunition.
29 Jul 81, 13p Rept no. GAO/PLRD-81-54

This study has found that the Navy's Conventional Ammunition Inventory Management System (CAIMS) does not provide the required accountability to effectively manage sizable ammunition inventories. The Navy has been unable to reconcile its inventory records with those of the single manager for conventional ammunition. Moreover, the inventory controls necessary to maintain accountability and visibility over fleet ammunition returned to weapons stations are either weak or nonexistent. Therefore, managers rely upon data that inaccurately reflect the quantity, location, and condition of this ammunition. Sound management practices are needed to correct these weaknesses. Six recommendations are provided.

Hayya (Jack C.) Associates, State College, PA.
Forecast of the Second Destination Transportation Tonnage for the Air Force.
Final rept.,
Jack C. Hayya. Feb 79, 51p
Contract F33615-78-C-5214

This study analyzed the time series of second destination tonnage and suggests models to forecast them. An assortment of models were attempted including: exponential smoothing, polynominal regression, and

Box-Jenkins, and the author found that a range of models can be used to forecast tonnage. The models were applied to eleven tonnage series, and two different types of forecasting models were recommended based on the principal of cost-effectiveness; single exponential smoothing for nine of the series, and decomposition of the remaining two. There is no implementation cost in terms of computer programming or training in following these recommendations. Only two values are stored for exponential smoothing--the current tonnage and the forecast for current period. Time series decomposition requires the use of seasonal indices only. Seasonal indices are provided by the author. (Author)

An Evaluation of Spares Acquistion Integrated with Production,
Brenda J. Allen, and John B. Abell. Aug 81, 111p
Rept no. LMI-ML108
Contract MDA903-81-C-0166

Spares Acquisition Integrated with Production (SAIP) is the concurrent procurement of items to serve as spares and items to be installed as components of weapon systems. It is cost-effective during initial provisioning and may remain so throughout weapon-system production. The two most important characteristics of SAIP that support this conclusion are: (1) SAIP results in lower unit prices, not only for spares but also for components to be installed during production (production installation items); and (2) SAIP enhances the timely availability of spared, and thus weapon-system readiness. We recommend that the Office of the Secretary of Defense: (1) Require evaluation of SAIP for the initial provisioning for all major weapon-system acquisition programs. (2) Revise DoD Directive 4140.40 to allow the concurrent procurement of spares and production installation items; (3) Require evaluation of SAIP for replenishment provisioning, in conjunction with the economic with the economic analysis undertaken to decide whether procurements should be broken out from the prime contractor; and (4) Revise DoD Directive 7200.4 to allow the advance procurement of long-leadtime spares prior to the fiscal year in which the related end item is to be procurred.

Information on the U.S. Coast Guard's Decision to Purchase the M/V Cowslip Vessel.
25 Jun 81, 7p Rept no. GAO/CED-81-128

We have reviewed the Coast Guard's decision to purchase the Cowslip and found no basis to conclude that the purchase decision was improper. However, the Coast Guard relied on its own assessments of the relative conditions of both vessels. These assessments were not verified by a separate Coast Guard in-house assessment or by commercial vessel surveyors. Furthermore, cost comparisons developed by the Coast Guard and used in the purchase decision were based on cost estimates provided by the Coast Guard's Office of Engineering and were not independently verified. The final decision to purchase the Cowslip was approved by the Assistant Secretary for Administration, Department of Transportation. In conducting our work we reviewed Coast Guard vessel inspection reports and purchase, renovation, and repair cost data used in evaluating the relative merits of the two vessels and arriving at the purchase decision. We met with and held discussions with Coast Guard officials who (1) performed the vessel inspections, (2) developed the cost data used in making the purchase decision, and (3) made the decision to purchase the Cowslip. We also held discussions with Department of Transportation officials involved in the purchase decision. Our work was conducted at Coast Guard and Department of Transportation Headquarters in Washington, D.C.

Aviation Materiel Combat Ready In-Country (AMCRIC).
Agency rept.,
Herman M. Orrell, III. Jun 81, 58p

A previous study--titled Aviation Materiel Combat Ready In-Country (AMCRIC)--was provided as a basis to develop a concept to preposition Army aircraft in US Army Europe. This study recognized that aircraft are not authorized as war reserve, and that no aircraft are currently included in POMCUS in Europe. To adequately reinforce NATO, some method had to be devised to allow Army aircraft to be immediately available to a deploying combat force. The project considered: (a) Methods available to accomplish prepositioning of Army helicopters and ancillary systems; (b) South Vietnam Army aviation experience in combat; (c) State-of-the-art storage methods by US Government, foreign governments, and commercial contractors; and (d) Major command interfaces within the US Army that will be required to establish a workable concept. The project results were that US Army has the capability to store helicopters for short periods using on-hand resources; and The Vice Chief of Staff, Army, approved a prepositioning concept developed which will store helicopters in USAREUR on a test bed basis using AH-1S helicopters.

Military Contractor-Operated Stores' Contracts are Unmanageable and Vulnerable to Abuse.
Report to the Congress.
8 Jul 81, 71p Rept no. GAO/MASAD-81-27

Contractor-operated base stores were once envisioned as a practical and cost-effective means for buying vehicle repair parts and civil engineering supplies, but are now plagued by pricing irregularities, contract abuses, and repeated allegations of fraud. The Department of the Air Force, despite concentrated efforts over the last several years, has been unable to develop a workable store contract for purchasing the thousands of low-cost, commercial items its bases need daily. GAO thinks the Secretary of Defense should discontinue the use of contractor-operated stores. Workable, cost-effective alternatives, such as the Government-operated stores, should be used to establish purchasing control. (Author)

Implications of Power Plant Coal Conversions on the Ports of New England: Volume I.
Final rept.,
Jeffrey P. Osleeb, and Samuel J. Ratick. Oct 81, 65p MA-RD-940-82004
See also PB82-136417.

This document presents the results of a systematic study of the transportation of coal into the New England region. This coal movement is to satisfy the anticipated energy demands of the electric utilities in the regions which have been ordered to convert to coal under the 1978 Fuel Use Act. Historically, waterborne movements of coal into the New England region were very important. The results of this analysis indicate that waterborne movements of coal can once again predominate. Even with the added investments necessary for the construction of new coal handling equipment at the ports of New England and the costs associated with additional coal transfers, water modes tend to be the most economical.

Implications of Power Plant Coal Conversions on the Ports of New England. Volume II: Appendices,
Jeffrey P. Osleeb, and Samuel J. Ratick. Oct 81, 206p MA-RD-940-82004
See also PB82-136409.

Mandated electric generation coal conversions in New England could place a severe strain on the coal handling and transportation facilities in New England ports. This paper presents an analytical scheme leading to the development of optimal plans for the reuse and redevelopment of marine transport networks in New England. Utilizing a port inventory that provides information on existing coal handling facilities and the capability of the ports to increase capacity, a mathematical programming model is used to determine the optimal capacity, placement, and railroad and marine interface of coal handling facilities within and between the New England ports and converting power plants.

Questionable Use of the C-X and Other Air Force Weapon System Funds.
10 Sep 81, 6p Rept no. GAO/MASAD-81-41

The C-X is one of several weapon systems being managed by the Deputy of Airlift and Trainer Systems (Deputy for Airlift), Aeronautical Systems Division (ASD), Air Force Systems Command (AFSC), Wright-Patterson Air Force Base, Ohio. Some matters concerning the Air Force's use of weapon system funds came to our attention during our review of the C-X which we believe warrant your attention. Specifically, about $531,000, or 36 percent, of the C-X funds released by AFSC to ASD's C-X System Program Office (SPO) as of July 1, 1981, had been allocated for a building renovation, purchase of general-purpose automatic data processing equipment, and a management information system study. In our opinion, we question whether these funds have been used in a manner contrary to the intent of the congressional approval of the C-X program. Also, the continuing use of C-X funds in this manner may be inappropriate because the costs of such general-purpose projects, which are necessary for ASD to carry out its basic mission of developing and acquiring weapon systems, are normally charged to acquisition and command support funds rather than mission program funds. Mine/Countermine Problems During Winter Warfare.
Final rept.,
Virgil Lunardini. Sep 81, 53p Rept no. CRREL-SR-81-20

The possibility of modern warfare being waged under cold weather conditions has raised questions about the effectiveness of conventional and new mine systems during the winter. A workshop on mine/countermine winter warfare was held at the U.S. Army Cold Regions Research and Engineering Laboratory, 21-23 October 1980, to define problems related to cold climates. The designer, developer and user communities sent 22 representatives from 16 organizations outside of CRREL. Discussion papers were prepared by four groups, covering emplacement of mines, mine performance, detection of mines, and neutralization of mines. The emphasis was on the unique problems of the winter environment. It appears that the U.S. has the capability to conduct defensive warfare during the summer but is not adequately prepared for mine/countermine winter warfare. Test and research programs are called for to compensate for the prior lack of consideration of the winter environment, to adequately winterize new mine/countermine systems, and to formulate appropriate doctrine for defensive winter warfare. The Soviet View of Local Wars and Wars of National Liberation: Strategy and Concepts of Employment.
Research rept.,
Edward S. Pusey. Jun 81, 26p Rept no. 2291

The Soviet view of local wars and wars of national liberation is examined. The author describes the Soviet theoretical premises for causes of these wars and their role in the foreign policy of the Soviet Union. Using Soviet sources, the author describes the historical course of local wars and wars of national liberation and the strategy and concepts of employment that the

Soviet Union intends to use to insure victory in a timely manner. He concludes that the local war, or the national liberation war, from the Soviet point of view, is and will continue to be a viable foreign policy option for the Soviet Union.

Terrorism; A Bibliography of Books and Periodical Articles.
Final rept.,
Lester L. Miller, Jr. 2 Nov 81, 12p Rept no. SB-80

This bibliography deals with the subject of terrorism which is the use of fear and violence to intimidate and thus coerce an individual or group for some political or societal goal. It is the latest in a long list of subject terms which have historically described such activity. Terms like guerrilla, insurgent, and revolutionist are included. As to its military application these include counterinsurgency, guerrilla, international terrorism, limited, revolutionary, or unconventional warfare. This number is arranged in two parts. Part one lists books. Part two 'A' lists periodicals by an arbitrarily devised acronym. Part two 'B' contains citations to periodicals by the acronym. Selection has been made from various materials owned by the Morris Swett Library. Inclusion of an item, or omission, does not imply USAFAS indorsement or sanction of the compiler's point-of-view. Contract DAHC19-77-C-0018

Discussed are improved procedures/data processing methodologies for forecasting battlefield personnel attrition and for reporting logistics status. Two active Army divisions provided information vis-a-vis how the two lattermentioned functions now are performed manually. This information provided the basis for the development of a data processing strategy concept which, if implemented in an automated tactical data system, should greatly improve the accuracy and timeliness with which the functions addressed can be performed. An experiment conducted with Command and General Staff College students confirmed that the timeliness and accuracy of the target functions would be significantly improved.

Process for Fragment Layup, Filler Application, and Outer Coating for PATRIOT GM Warhead M248.
Final rept.,
Julian Z. Starostecki. Oct 81, 124p ARLCD-CR-81047, AD-E400 724
Contract DAAK10-79-C-0376

A mechanized production 'dry' system was developed with capability to layup steel fragments onto warheads metal parts assembly, to replace the currently used 'wet layup' process. The mechanized process decreases dependence on scarce skills, increases producibility, and makes quality controls more manageable. Three layers of steel fragments (1/4-in. (6 mm) cubes) are laidup with epoxy adhesive. Each layer is spirally wrapped and contains over 7,000 continuous fragments. The Grumman-developed Integrated Autowrap System includes the following features: (1) a tape adhesive for chaining the fragments and adhering them to the warhead, and (2) a Gruman redesigned, fragment chain-wrap mechanism with hopper feed that aligns the fragments on the tape adhesive. The chain-wrap mechanism follows a spiral path to layup the fragments on the warhead ogive. This mechanized layout capability eliminated the need for the glass fabric-reinforced epoxy overwrap, the manual skill for spreading epoxy adhesive over the bonding surfaces, and three separate 12-hr room-temperature cures (one for each of the fragment layers). The Autowrap System made it convenient to accomplish 100% inspection of the positioned fragments prior to adhesive curing and improved the dimensional and weight controls for the PATRIOT Warhead Inert Parts Assemblies. Scale Modeling for the PATRIOT Electromagnetic Pulse Test.
Technical memo.,
Andrew A. Cuneo, Jr., and James J. Loftus. May 81, 99p Rept no. HDL-TM-81-16

Experimental electromagnetic coupling studies were made of a scale model of the PATRIOT air defense system as part of the evaluation of this system's ability to survive exposure to an electromagnetic pulse (EMP). This exercise was primarily concerned with providing basic information this is either too costly and time consuming or impossible to obtain in a full-scale field operation. This basic information consists of the answers to such questions as these: how the external receptor currents change with variations of the incident field's azimuthal and elevation angles as well as polarization, what the effect of cable routing is on EMP coupling, and how critical the system grounding is to EMP protection.

Missile Safety Qualification of Short Range Air Defense (SHORAD) Missiles.
Final rept. on test operations procedure.
23 Sep 81, 32p Rept no. TOP-5-2-619

This Test Operating Procedure (TOP) provides procedures for safety qualification (SQ) testing of short range air defense (SHORAD) missiles during Development Testing (DT I, II, III) and First Article Initial Production Tests (FA-IPT). Safety qualification tests may be conducted on pre-production missile configurations to support safety releases for operational tests. It is essential that safety qualification tests be conducted on production configuration rounds, on production items from a new vendor, and on first items produced after a production line has been idle 6 months or longer. These tests are also applicable to Product Improvement Programs when changes are made to warhead, missile rocket motor assembly, or other components which could affect stockpile-to-launch safety. Tests conducted in accordance with this TOP are limited to missile only and intended to be conducted on complete tactical SHORAD missile rounds except as noted.

Source Ranging by a Single Array in a Multipath Ocean.
Research rept. Oct 79-Sep 80,
J. A. Neubert. Apr 81, 16p Rept no. NOSC/TR-681

The objective of this work was to develop a possible way of source ranging by a single array in a multipath ocean and to indicate its limitations. It was shown that mean-square sound-level fluctuations for a single sensor in a random multipath environment are directly dependent on the source range. When this was applied to an array of sensors, the result showed that a single horizontal line array might track a moving source in a multipath ocean environment. This result would facilitate the inter-array communication problem for coherent multi-array processing (CMAP) tracking of submarines. It is recommended that this tracking method be further tested with even more suitable data.

Underwater Target Tracking Using Measurements from a Linear Array of Omnidirectional Acoustic Elements.
Technical rept.
22 Oct 81, 63p Rept no. NUSC-TR-6010

Tracking of underwater targets using measurements from a geometrically linear array of omnidirectional acoustic elements is a nonlinear estimation problem. The technique constructed and used in this report is an iterative, least-squares algorithm which uses the modified Gauss-Newton method. In this algorithm the search direction is found by applying a Householder transformation to the Gauss-Newton equations; the size of the step in this direction is found by minimizing a polynomial approximation to the performance index. The results show: the sign on the estimate of the target's depth cannot be uniquely determined, the Gauss-Newton method works as well as its modified version for these experiments, the problem is singular on the first leg, and the initialization of the algorithm influences convergence. Sonar Image Processing. An Application of Template Matching through Relaxation.
Interim rept.,
Charles E. Thorpe. 9 Oct 81, 12p Rept no. CMU-RI-TR-81-6
Contract N00014-81-K-0503

This paper discusses the use of high-level templates and relaxation techniques in processing side-scan sonar images. The images examined do not have enough resolution to identify the objects individually. Distances and orientations among groups of objects are stable, however, and provide the information necessary to unambiguously identify each object. The identified targets are then used to provide navigation information for underwater vehicles. Much of the work described is an application and refinement of established techniques, most directly those of Davis. Low-level filtering, template matching, relaxation and M* search are all discussed. (Author)

IRIG-TIME Synchronized Binary Video Data Inserter.
Final rept.,
Federico Salvatti, Jr. Sep 81, 28p Rept no. STEWS-ID-81-2

The Binary Video Inserter (BVI) was developed to insert binary data into a video signal. A Video Synchronizer was developed to synchronize the BVI to IRIG-B range time. The combination provides a Synchronized Binary Video Inserter (SBVI) in support of a program to replace film-based mobile cinetheodolite instrumentation presently in use at WSMR. The SBVI satisfies the following objectives: synchronizes shuttered video cameras to IRIG-B time; provides timing and control signals to achieve high frame rate capability for recording launch area and miss distance event data; insert time, instrument encoder data, and other data into the video signal for computer-assisted processing; and provide error recovery capability for the inserted data. Flow Control and Routing Techniques for Integrated Voice and Data Networks,
Oliver C. Ibe. Oct 81, 29p Rept no. LIDS-P-1153
Contract N00014-75-C-1183, ARPA Order-3045

We consider a model of integrated voice and data networks. In this model the network flow problem is formulated as a convex optimization problem. The objective function comprises two types of cost functions: the congestion cost functions, which limit the average input traffic to values compatible with the network conditions; and the rate limitation cost functions, which ensure that all conversations are fairly treated. A joint flow control and routing algorithm is constructed which determines the routes for each conversation, and effects flow control by setting voice packet lengths and data input rates in a manner that achieves optimal tradeoff between each user's satisfaction and the cost of network congestion. An additional congestion control protocol is specified which could be used in conjunction with the algorithm to make the latter respond more dynamically to network congestion. (Author)

FAA's Communications Equipment Replacement Plans.
29 Jul 81, 3p Rept no. GAO/MASAD-81-37

A review of the Federal Aviation Administration's (FAA's) voice communications equipment replacement plans were completed. FAA had planned a two-phased effort to replace the existing leased telephone switching and FAA-owned radio control equipment. Some equipment would be replaced during the early 1980s with interim off-the-shelf leased or purchased equipment while the follow-on Voice Switching and Control System VSCS was being developed. We felt VSCS was not required because (1) hard-wired and patch panel controlled equipment, rather than computer controlled equipment, would satisfy the circuit reconfiguration requirement, (2) much of the in-use equipment would last for many years, and (3) the replacement of older equipment with off-the-shelf equipment, rather than VSCS, would be more cost effective. Accordingly, we recommended that you direct FAA to (1) discontinue research and development on VSCS and cancel its planned purchase; (2) use the planned interim buy off-the-shelf equipment to obtain needed equipment to meet new requirements and replace equipment no longer cost or operationally effective; and (3) revise the draft specifications for the interim equipment to allow more competition and the selection of the lowest cost equipment (hard-wired, patch panel controlled, or computer controlled equipment).

Air Force Inst. of Tech., Wright-Patterson AFB, OH.
Analysis of Flow Behavior Within An Integrated Computer-Communication Network,
Carroll Ardee Clabaugh. May 79, 272p Rept no. AFIT-CI-79-213D

This research concerns itself with the flow behavior in a computer-communication network that integrates data and voice classes of traffic. This behavior is analyzed as a queueing problem by modeling nodes and channels and evaluating their behavior under different arrival rates. Switching mechanisms, flow control considerations, and the development and use of simulation and analytical models are emphasized. Prominent flow control strategies are classified into a framework for potential utility as regulating controls in an integrated environment. An event-driven FORTRAN network simulator is developed based on common call management, traffic integration on trunk lines, and an underlying circuit switched communications subnet. The network simulator is a cost-effective portable tool that has application in an environment where computer resources are limited. An algorithm is formulated that permits decomposition of the network into nodal configurations. A FORTRAN program is developed that implements this algorithm.

Digital Signal Sorting for Digitized Speech in an Environment of Common Digital Data Signals.
Final rept.,
Roger E. Salters. Jan 80, 35p Rept no. USAFA-TR-80-5

This report discusses a digital signal sorting technique for identifying digitized speech signals in an environment of common digital data signals. The technique is modular in that two levels of recognition are possible: (1) a linear prediction based scheme which provides a fine-grain recognition; and (2) a digital word synchronization scheme which provides a coarse, or first cut recognition. In the fine-grain scheme, a discrimination measure defined herein is shown to provide good sorting of the digitized speech sequence - this is demonstrated through examples. (Author)

Guidelines for Managing the Flow of Information in an Automated Battlefield Command and Control System.
Research rept. May 79-May 80,
Cathleen A. Callahan, Robert W. Blum, Gary Witus, and Mark Graulich. May 80, 90p VRI-ARI-3-FR80-2, ARI-RR-1248
Contract DAHC19-78-C-0027

This report documents research directed towards the development and evaluation of guidelines for Standing Operating Procedures (SOP) for managing information flow in automated battlefield command and control systems. This research was performed during the second phase of a project to develop information management concepts and procedures for tactical operations systems. Three stages of SOP guideline development are discussed: (a) identifying critical problems; (b) developing candidate management procedures to address the critical problems; and (c) evaluating the

efficacy and side effects of the candidate procedures. (Author)

Application of Digital Troposcatter to the DCS.
Technical rept.,
J. L. Osterholz, and W. J. Cybrowski. Sep 80, 148p
Rept no. DCEC-TR-10-80

A DCS digital troposcatter requirements and technology baseline is presented for use by system planners and managers. The current troposcatter link inventory is reviewed to identify those links most likely to be digitized and retained through the 1990's. Current developments in digital troposcatter technology are reviewed, including the results of key tests. Provisional design criteria which were developed for digital troposcatter links based on this testing are presented. This report supersedes draft DCEC TR 17-76, 'Integration of Digital Troposcatter into the Defense Communications System' and draft DCEC TR9-79, 'Application of Digital Troposcatter to the DCS'. Guideline Development for Summarization of Tactical Data.
Interim rept. 15 Mar 79-15 May 80,
Michael G. Samet, and Ralph E. Geiselman. May 80, 138p ARI-TR-458
Contract DAHC19-78-C-0027
Prepared in cooperation with Perceptronics, Inc., Woodland Hills, CA, Rept. no. PDFTR-1083-80-5.

The present study was conducted to validate and expand the generalizability of a set of guidelines for summarizing tactical message content, and to develop guidelines for conducting a manual purge of a message file. Thirty-two Army staff officers studied a scenario and 30 enemy-situation-data (ESD) messages describing an enemy defensive operation. Their task was to summarize the tactical information in the form of an intelligence briefing. Half the officers were supplied with three general guidelines to follow in preparing the summary: (1) provide an interpretation of the data, (2) give a dynamic portrayal, and (3) use conversational style. After the summarization task, the participants were asked to delete 15 of the 30 messages and to rank-order the rest on the basis of importance. The 32 summaries were evaluated by seven military raters in terms of quality of content, interpretation, accuracy, organization, and style. The raters judged the summaries prepared with the aid of the guidelines to be significantly 'better' summaries on an overall evaluation scale and on four of five qualitative scales. Potent positive effects were revealed for all three guidelines. The ten summaries that received the highest overall evaluations were used to derive a general suggested outline for describing the message content.

The Worldwide Navigational Warning Service,
J. E. Ayers, and John P. Lyall. 1981, 14p

In the early 1970's both the International Hydrographic Organization (IHO), an intergovernmental agency dedicated to the improvement of nautical charting, an the Intergovernmental Maritime Consultative Organization (IMCO), a U.S. agency dedicated to safety of life at sea, became concerned over the lack of a coordinated worldwide radio service to keep deep sea mariners aware of hazards to navigation. Through their joint efforts the Worldwide Navigational Warning Service (WWNWS) was established, becoming fully operational on 1 April 1980. The WWNWS covers all international shipping routes through a system of 16 NAVAREA Broadcasts, all of which transmit warnings in English (the primary language of the NAVAREA II broadcast is in French) and some of which transmit warnings also in an additional language. This paper describes the development of the initial WWNWS, the mechanism for service improvement and advances which have been made to date, and improvements foreseen for the future. Specific examples from the broadcast experience of the Coordinator for NAVAREA IV and XII and the Northwest Atlantic and Northeast Pacific NAVAREAs, respectively, are given. (Author)

Design Methodology and Development History of an ISO OSI Layered Architecture for the Canadian Broadcast Telidon System.
M. Sablatash, and R. Fitzgerald. Aug 81, 24p CRC-TN-708-E

To enable the Telidon System to be compatible with many other data communications devices, systems and networks, a layered protocol logically and conceptually consistent with the International Organization for Standardization's (ISO's) Reference Model for Open Systems Interconnection (OSI) was designed. The features and functions of the proposed design example are described. The protocol control information for each of the seven layers is described by giving specifications for services and functions provided in each layer, and additional descriptions and definitions as required. A general methodology for the design of ISC OSI layered information systems is briefly described.

Telecommunications in Cometary Environments.
W. L. Flock. 1 Jul 81, 43p NASA-CR-164956, JPL-PUB-81-84

Propagation effects on telecommunications in a cometary environment include those due to dust, the inhomogeneous plasma of the coma and tail, and ionization generated by impact of neutral molecules and dust on the spacecraft. Attenuation caused by dust particles is estimated to be on the order of 10 to the minus 5th power dB for the Halley Intercept Mission. Ionization generated by impact on the spacecraft is estimated to result in an electron content of 10 to the 12th power to 10 to the 13th power el/sq meters (3 eV electrons) along the telecommunications path. An estimate of the electron content due to Comet Halley itself is 10 to the 16th power to 10 to the 17th power el/sq meters, compared to a content of 10 to the 16th power to 10 to the 18th power el/sq meters for the Earth's ionosphere and 10 to the 17th power to 10 to the 18th power el/sq meters for the interplanetary medium. The electron content of the plasma near Comet Halley will cause excess range delay, and a Doppler shift of the signal from the spacecraft will occur in propagation to the rate of change of the path elrectron content. It is recommended that S and X down-link frequencies by employed to monitor the path electron content and amplitude scintillation and spectral broadening of the received signals. These measurements will provide a quantitative base of knowledge that will be valuable for radio science and telecommunications system design purposes.

Modulation/Demodulation Techniques for Satellite Communications. Part 4: Appendices.
J. K. Omura, and M. K. Simon. 1 Nov 81, 94p NASA-CR-164954, JPL-PUB-81-73
Contract NAS7-100

The use of the Viterbi algorithm in a general context is examined. The generalized transfer function bounds are given which permit the following applications to be carried out: maximum likelihood demodulation of such bandwidth modulations as minimum-shift-keying and continuous phase frequency-shift-keying, demodulation of intersymbol interference and partial response signals, estimation and smoothing, and simultaneous phase synchronization, and data detection. Sufficient conditions are reviewed for tightening Chernoff and Rhattacharyya bounds.

The Federal Side of Traditional Telecommunications Cost Allocations,
Anthony G. Oettinger, and Carol L. Weinhaus. c1980, 125p PUB/P-80-1

Whatever the outcome of legislative proposals before the 96th Congress, the structure of the telecommunications industry and its neighbors is being debated and will continue to be debated in numerous regulatory proceedings, court cases, federal and state legislative initiatives and international negotiations. Central to these discussions are 'proper costs' and their relationships not only to prices but also to other benefits or burdens. Costs have been allocated in the traditional telecommunications industry mainly by a two-stage process. First, explicit jurisdictional separations have allocated costs hence revenue requirements among the federal and all the state jurisdictions. Second, pricing rather than costing policy has determined the further incidence of benefits and burdens in the general absence of explicit suballocations of costs within the pools of costs assigned to the broad aggregates of interstate and state services. This part deals mainly with the first stage. (Copyright (c) 1980 by President and Fellows of Harvard College.)

The States Regulate Cable: A Legislative Analysis of Substantive Provisions,
Philip R. Hochberg. c1978, 147p PUB-P-78-4
Grant NSF-APR76-04827
Prepared in cooperation with Kalba Bowen Associates, Inc., Cambridge, MA.

At present, eleven states regulate cable television under comprehensive statutory programs which fall into three distinct patterns: regulation by the existing Public Utility Commission, a 'hybrid' arrangement which consists of a Cable Television Office within a PUC, and separate Cable Television Commissions. Substantive portions of cable statutes under all of these schemes are analyzed including the definition of CATV systems, general and specific powers of the agency, franchising standards, technical provisions, rate oversight, ownership, channel usage, and other provisions of cable regulatory statutes. States without comprehensive jurisdiction are also examined. (Copyright (c) 1978, Konrad K. Kalba.)

Taxation, Regionalization and Pole Attachments: A Comparison of State Cable Television Policies,
Larry S. Levine, Konrad K. Kalba, and Philip R. Hochberg. c1978, 134p
Grant NSF-APR76-04827
Prepared in cooperation with Kalba Bowen Associates, Inc., Cambridge, MA.

Policy outputs evolving from day-to-day administration of state cable television statutes and laws are examined in three issue areas: the tax environment in both regulating and non-regulating states; regionalization through line extension, interconnection, districting and case-by-case adjudication; and the pole attachments issue, including a history of state and federal involvement, the 1978 California pole statute, and implications of the 1978 federal legislation. The three studies are assessed in relation to several cross-cutting questions: (1) the extent of administrative flexibility in implementing state statutes; (2) the degree of convergence or divergence in policy approaches among states; and (3) the changing nature of state involvement in cable. The Regulation of Cable Television Subscriber Rates by State Commissions,
Larry S. Levine. c1978, 103p PUB-P-78-6
Grant NSF-APR76-04827

Prepared in cooperation with Kalba Bowen Associates, Inc., Cambridge, MA.

The traditionally conceived concerns of stakeholders in the rate regulation game, i.e. prevention of consumer 'gouging' by a monopolistic business v. overregulation by bureaucrats understanding little about the cable industry, are examined. Specific issues confronting these players, including whether or not there should be rate regulation at all, and if so, what form regulation should take, which systems and rates should be regulated, etc., are analyzed. The rate base rate-of-return method of regulation, as well as possible alternatives such as the common tariff procedure and 'cost of living' adjustments, are assessed and some new insights concerning how cable-related stakeholders (i.e. cable operators, state regulators, municipalities, etc.) view state rate regulation are offered. The Economic Impact of State Cable TV Regulation,
Yale M. Braunstein, Konrad K. Kalba, and Larry S. Levine. c1978, 86p PUB-P-78-7
Grant NSF-APR76-04827
Prepared in cooperation with Kalba Bowen Associates, Inc., Cambridge, MA.

This study describes the results of several econometric analyses of the effects of state cable television regulation on subscriber rates charged, penetration rates and ownership patterns. Data including age of the cable system, channel capacity, per capita income of the system community, number of off-the-air signals received in the community and system ownership were collected for a sample of 653 cable systems in 1971, 1974, and 1976. Results show that subscriber rates charged by systems in regulating states tended to be higher than rates charged by systems in states without state level regulation (although this difference had changed by 1976). Several explanations for this finding are discussed, including: the cost of regulation, geographic cost differences and management efficiency incentives. Other results show that comprehensive state regulation does not have a significant effect on: system penetration rates, growth of penetration and ownership patterns. A number of alternative definitions of penetration and ownership are described in relation to future research possibilities in this area. (Copyright (c) 1978, Konrad K. Kalba.)

Federal Preemption of State Regulation in Cable Television,
Philip R. Hochberg. c1978, 49p PUB-P-78-8
Grant NSF-APR76-04827
Prepared in cooperation with Kalba Bowen Associates, Inc., Cambridge, MA.

An overview of federal jurisdiction preemption over cable television regulation is presented. The history of federal assertion of jurisdiction is examined, emphasizing its impact on states, statutory preemption, regulatory preemption, and case law affecting authority over cable. Judicial decisions leading to the Federal Communications Commission Cable Television Report and Order in 1972 are reviewed, and subsequent decisions both upholding and denying federal jurisdiction are analyzed. The future of federal preemption is considered in light of current court and FCC decisions, as well as the introduction of congressional legislation dealing directly with federal preemption. Chronology of Cable Television Regulation: 1947 - 1978,
Anne E. Birinyi. c1978, 28p PUB-P-78-10
Grant NSF-APR76-04827
Prepared in cooperation with Kalba Bowen Associates, Inc., Cambridge,MA.

A chronological and contextual matrix is presented illustrating the evaluation of cable television regulation as it presently exists. Among the elements which have shaped current cable TV regulation are decisions made by state legislatures, state courts, and state regulatory agencies. These are shown along with decisions of the federal courts and the Federal Communications Commission in order to reflect the concurrent emergence of state and federal involvement in cable regulation. The advancement of the cable industry itself is charted in order to show the impacts of industry progress on both state and federal level decisions and attitudes. In addition, important position statements of stakeholders and study groups interested in cable, such as the National Association of Regulatory Utility Commissioners (NARUC), the House Subcommittee on Communications, and the Sloan Commission on Cable Communications, are included to represent the progression of cable television regulatory philosophies during the thirty-year period from 1947 to mid-1978. Private and Public Defenses Against Soviet Interception of U.S. Telecommunications: Problems and Policy Points,
Greg Lipscomb. c1979, 75p PUB-P-79-3

The Soviet Union is listening in on American domestic long distance telephone calls, apparently seeking strategic economic information. While the Carter Administration has decided not to interfere directly, it has formed a White House task force charged with frustrating this Soviet practice. The author discusses the problems of securing private industry communication. Should equipment be compatible, and thus vulnerable to questions of privacy and trust. Or should each system be individualized, a distinct inconvenience to mobile corporate executives. Who should bear the costs, the general taxpayer or the corporate consumer.

Compunications Network Management,
Robert H. Klie. c1981, 82p PUB-P-80-4

How growing competition will influence the effectiveness and efficiency of compunications facilities or services is a controversial matter of some importance to both clients and suppliers of these facilities or services. Network management is one focus of controversy. To caricature one extreme position on network management, only AT&T's leadership and dominance are up to doing it right. To caricature the other extreme, the invisible hand in an unfettered competitive market can do it better. In order to formulate policy in this area five basic questions must be considered: manage what, why, how, to what extent, and at what cost. In this paper, the author addresses the questions what and why in the belief that better understanding and perhaps agreement on these points can shed some light on how and how much to manage.

Selective Fading on a Long 8 GHz Line-of-Sight Path in Europe.
Technical rept. 1 Feb-30 Dec 80,
L. B. Hause. Sep 81, 97p NTIA/REPORT-81-84
Sponsored in part by Defense Communications Engineering Center, Reston, VA.

This report presents the description, analysis and results of a set of measurements made on a 90 km line-of-sight path in Italy. The measurements were made during the late spring of 1980 by the National Telecommunications and Information Administration under the sponsorship of the Defense Communication Engineering Center, Reston, VA. Received signal level and IF spectrum were measured to obtain statistics about the distortion of the frequency spectrum amplitude during periods of multipath fading. Digital format violation and reframe events were monitored to measure the tolerance of the 3-level-partial-response radios (12.6 Mb/s) to this distortion.

Contract ASL-79-8116

The Munitions Bare Charge Equivalence/Dusty Infrared Test II (MBCE/DIRT II) test series was conducted as a joint field experiment by the Atmospheric Sciences Laboratory and the U.S. Army Engineer Waterways Experiment Station (WES) at White Sands Missile Range, N. Mex., in July 1979. The purpose of the DIRT II portion of the test was to measure the transmission of optical energy through the obscurants generated by explosives interacting with the terrain. This report describes procedures and measurements conducted by the Environmental Laboratory of WES to establish the relevant physical properties of the test site for use in determining the nature and amount of the obscurant material. A portion of this effort was also devoted to the selection and description of a standard set of measurements and sampling procedures for general use in such tests. The resulting set is described along with the rationale behind it. (Author)

Automatic Handoff of Multiple Targets.
Final technical rept. 10 Oct 80-14 Sep 81 on Phase 2,
J. S. Boland, III , H. S. Ranganath, and D. V. Satish Chandra. 14 Sep 81, 166p DRSMI/RG-CR-81-4, AD-E950 176
Contract DAAH01-80-C-0258
See also report dated 30 Sep 80, AD-A093 483.

In order to fully utilize the potential of the 'fire and forget' class of helicopter-borne missiles, it is necessary to solve the technical problems associated with acquiring and handing off multiple targets from a precision pointing and tracking system (PTS) to several missile seekers simultaneously or almost so in a short period of time. The multiple target problem is that of locating targets and missile seeker aim points within the PTS field of view, deciding which target is to be assigned to each missile, generating error signals to the torquers in order to slew the missile LOS such that its assigned target is in the center of its FOV, and initiating automatic seeker tracking. The task of locating a given smaller image within a larger image is known as 'image registration'. A detailed comparison of the important multiple image registratin methods based on the number of arithmetic operatins for software implementation and the complexity of hardware for real time implementation is presented. New methods of accomplishing multiple image registration which are computationally more efficient than the most commonly used template matching techniques (correlation and sequential similarity detection algorithm) are described. Several methods are compared with respect to hardware requirements and speed of computation. (Author)

Review of Department of Transportation's Response to Recommendations in the Senate Report on the Federal Aviation Administration's En Route Air Traffic Control Computer System.
1 Jun 81, 11p Rept no. GAO/AFMD-81-66

In its report, the Senate investigations staff found that FAA has not effectively managed its en route computerized air traffic control system. Because of weaknesses in reporting equipment outages, lack of planning, and a poorly defined approach to managing system operations and software changes, FAA cannot be certain that the current system will operate at a level that will ensure the safety of the traveling public until the proposed replacement system is operational. The Senate investigations report contained nine recommendations to FAA. The Committee of Conference established reporting milestones for each of the recommendations. Further, the Committee of Conference directed that FAA report its actions on the recommendations to the appropriate committees by specific milestone dates. (Author)

Simulator Evaluation of Electronic Radio Aids to Navigation Displays, the RA-1 Experiment.
Interim rept.,
R .B. Cooper, K. L. Marino, and W. R. Bertsche. Jan 81, 183p Rept no. EA-80-U-86
Contract DOT-CG-835285-A

This report describes a ship's bridge simulation evaluation of electronic radio aids to navigation displays conducted for the purpose of trading off display information effectiveness with operational requirements and shipboard system cost. The experiment known as RA-1 is the second of a series of experiments which are addressing DIGITAL, GRAPHIC, PERSPECTIVE and STEERING display formats with various noise and filter characteristics. The first, a miniexperiment of abbreviated length, selected five of the most operationally effective display designs from among 18 original display formats. To these were added two predictor steering displays for a total of seven displays; all to be evaluated in the more stringent, full-length RA-1 simulation. As a result of superior pilotage performance shown in this experiment, a true motion, trackup GRAPHIC display with either course or heading vectors is recommended as the 'benchmark' display for inclusion in a future RA-2 simulation. The RA-2 experiment will evaluate the 'benchmark' display's effectiveness in a radio aids to navigation noise environment and as a function of system filtering characteristics and the implementation of gyro aiding. The simulation of the noise environment and system filtering characteristics is evaluated in this report.

Aids to Navigation Principal Findings on the CAORF Experiment. The Performance of Visual Aids to Navigation as Evaluated by Simulation.
Interim rept.,
M. W. Smith, and W. R. Bertsche. Feb 81, 170p EA-80-U-051, USCG-D-51-81
Contract DOT-CG-835285-A

The experiment described in the present report is the first of a series done for the U.S. Coast Guard to quantify the relationship between variables related to aids to navigation and piloting performance in narrow channels, and, therefore, safety in such channels. The present experiment was restricted to visual piloting, and, further, to buoys only. It was done at CAORF, the Maritime Administration's Computer Aided Operations Research Facility in Kings Point, New York. The variables evaluated were: straight channel marking (staggered versus gated buoys), spacing (5/8 versus 1-1/4 nm), turnmarking (one versus three buoys), day/night, detection range (3/4 versus 1-1/2 nm), angle of turn (15 versus 35 degrees), and turn radius (noncutoff versus cutoff). A scenario was planned to include both trackkeeping and maneuvering tasks done both with and without perturbation. The findings are presented as the means and standard deviations of the crosstrack position of transits under each condition. They are interpreted in terms of their implications both for channel design and for an understanding of the piloting process. (Author)

Simulator Evaluation of Electronic Radio Aids to Navigation Displays--The Miniexperiment.
Interim rept.,
R. B. Cooper, and K. L. Marino. Sep 80, 122p EA-80-U-88, USCG-D-59-80
Contract DOT-CG-835285-A
See also report dated Dec 79.

This report describes a simulator evaluation of electronic radio aids to navigation displays conducted for the purpose of trading off display information effectiveness with operational requirements and shipboard system cost. The miniexperiment, a predecessor to more lengthy experimentation, utilized an abbreviated scenario to operationally simulate 18 display formats. Six digital, ten graphic, and two perspective displays were evaluated. The digital display was designed to provide trackkeeping and turning information that would enable a pilot to transit the waterway while using an inexpensive digital (alphanumeric or numeric only) display. The graphic display was designed to provide a pictorial representation of ownship in the waterway similar to the way it is viewed on radar, contemporary collision avoidance, or navigation option displays. The perspective display was designed to portray the perspective scene as viewed out the forward bridge windows. Pilot performance using each of the displays is discussed and analyzed, and seven displays were recommended for further evaluation in the full-scale experiment. (Author)

AUTOPILOT: A Distributed Planner for Air Fleet Control.
Interim rept.,
Perry W. Thorndyke, David McArthur, and Stephanie Cammarata. Jul 81, 34p Rept no. RAND/N-731-ARPA
Contract MDA903-78-C-0029

Distributed planning requires both architectures for structuring multiple planners and techniques for planning, communication, and cooperation. We describe a family of systems for distributed control of multiple aircraft, in which each aircraft plans it own flight path and avoids collisions with other aircraft. AUTOPILOT, the kernel planner used by each aircraft, comprises several processing experts that share a common world model. These experts sense the world, plan and evaluate flight paths, communicate with other aircraft, and control plan execution. We discuss four architectures for the distribution of airspace management and planning responsibility among the several aircraft occupying the airspace at any point in time. The architecture differ in the extent of cooperation and communication among aircraft. (Author)

The Effect of Ionospheric Variability on the Accuracy of High Frequency Position Location.
Final rept.,
Melvin G. Heaps. Aug 81, 46p Rept no. ERADCOM/ASL-TR-0095

The attainable accuracies in high frequency (HF) radio wave position location over ranges of several hundred kilometers are beset with errors of tens of kilometers due to constraints in three major areas: ionospheric variability and irregularity; system size limitations for easily fieldable systems; and sufficient data acquisition, processing, and interpretation. Of principal concern here is the area of ionospheric variability and irregularity. The temporal and spatial coherence of ionospheric structure has been considered with respect to its effect on the accuracy of HF position location. The findings show that medium and small-scale ionospheric structures most likely to affect HF position location accuracies have a spatial coherence on the order of 50 km and a temporal coherence on the order of 5 minutes. On this basis it is recommended that a multiple ionosonde net be used instead of a single ionosonde, such that an ionospheric sounding point is no more than 50 km from a potential radio wave reflection point, and that soundings be taken on the order of every 5 minutes or less. Air Force Systems Command, Washington, DC.
Continental United States Over-The-Horizon-Backscatter (OTH-B) Radar System. Supplement.
Final environmental impact statement.
9 Oct 81, 18p Rept no. AFSC-TR-81-64-SUPPL
Availability: Microfiche copies only.

This supplement amends the Final Environmental Impact Statement issued in January 1975. The action proposed in the 1975 EIS was to construct and operate an OTH-B radar System in Maine, initially covering a 60 degree sector, and later expanded to cover 180 degrees . The action proposed in this supplement is to locate the integrated operations, maintenance, and security facility at Bangor International Airport, a location not considered in the 1975 EIS. Alternatives are locating at Bucks Harbor the maintenance and security personnel who support the Washington County receiver site, but leaving the maintenance and security person-

nel for the operations center and the Somerset County transmitter site with the operations personnel at Bangor International Airport; and not deploying either the 60 degree or the 180 degree system. (Author)

Final technical rept. 7 Mar 79-7 Mar 81,
Harvey K. Schuman, Donald R. Pflug, and Larry D. Thompson. Aug 81, 101p RADC-TR-81-215
Contract F30602-79-C-0116

The present status of the space-based radar phased array lens simulator is discussed. Huge arrays of thin wire radiating elements on either side of a ground screen are modeled by the simulator. Also modeled are amplitude and phase adjust modules connecting radiating elements between arrays, feedline to radiator mismatch, and lens warping. A successive approximation method is employed. The first approximation is based on a plane wave expansion (infinite array) moment method especially suited to large array analysis. the first approximation results then facilitate higher approximation computations that account for effects of nonuniform periodicities (lens edge, lens section interfaces, failed modules, etc.). The programming to date is discussed via flow diagrams. An improved theory is presented in a consolidated development. the use of the simulator is illustrated by computing active impedances and radiating element current distributions for infinite planar arrays of straight and 'swept back' dipoles (arms inclined with respect to the array plane) with feedline scattering taken into account. Linear Frequency Modulation Derived Polyphase Pulse-Compression Codes and an Efficient Digital Implementation.
Interim rept.,
B. L. Lewis, and F. F. Kretschmer, Jr. 2 Nov 81, 11p Rept no. NRL-8541

In previous publications, the authors introduced a new class of polyphase pulse-compression codes and techniques for use in digitally coded radars. Such codes and compressors can be employed to obtain much larger time-bandwidth products (pulse compression ratios) than are feasible with analog dispersive delay lines. It is the purpose of this report to extend this class to include two new codes, one of which is tolerant of precompression bandwidth limitation. These new phase codes are conceptually derived from a linear frequency modulation waveform (LFMW) and are more doppler tolerant than other phase codes derived from a step approximation to a LFMW. This report will also describe an efficient technique for implementing these new phase codes in a digital pulse-expander-compressor and will present performance data. It should be noted that these phase codes are designed to be used both on transmission and reception to insure that the receive filter matches the transmitted waveform independent of time differences between the leading edge of the echo and a sampling pulse, i.e., independent of target range. The two new phase codes will be called the P3 and P4 codes to distinguish them from the P1 and P2 codes. The P3 code is not precompression bandwidth limitation tolerant, but is much more doppler tolerant than the Frank or P1 and P2 codes. The P4 code is a rearranged P3 code with the same doppler tolerance and with better precompression bandwidth limitation tolerance.

Atmospheric Fluctuations Which Lead to Trackable Radar Signals in the Marine Boundary Layer.
Final rept. 1 Aug 80-31 Jul 81,
W. S. Lewellen, H. Segur, R. I. Sykes, and C. P. Cerasoli. Jul 81, 128p Rept no. ARAP-450
Contract N00014-80-C-0873

A description and rough cataloguing of the dominant types of fluid dynamic features which may be expected to yield trackable radar targets in the atmospheric boundary layer is provided. Conditions favorable for target motion relative to the ambient wind velocity are discussed. One particularly interesting type of wave generated target is that involving Kelvin-Helmholtz wave breaking which occurs when a wave of sufficient amplitude passes through a slightly stable fluid shear layer. This type of wave breaking is examined numerically using A.R.A.P.'s second-order closure turbulence model. This normalized computation allows the evolution of the radar pattern for this particular type of event to be interpreted in terms of the temperature, humidity, and velocity across a particular shear zone, and the wave speed of the triggering internal wave.

Synthetic Aperture Radar Target Simulator.
Patent Application,
H. A. Zebker, D. N. Held, R. M. Goldstein, and T. C. Bickler. Filed 17 Jul 81, 15p N82-10286/4, NASA-CASE-NPO-15024-1
Contract NAS7-100
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A simulator for simulating the radar return, or echo, from a target seen by a SAR antenna mounted on a platform moving with respect to the target is described. It includes a first-in first-out memory which has digital information clocked in at a rate related to the frequency of a transmitted radar signal and digital information clocked out with a fixed delay defining range between the SAR and the simulated target, and at a rate related to the frequency of the return signal. An RF input signal having a frequency similar to that utilized by a synthetic aperture array radar is mixed with a local oscillator signal to provide a first baseband signal to provide a first baseband signal having a frequency considerably lower than that of the RF input signal.

Purdue Univ., Lafayette, IN. School of Electrical Engineering.
An Application of Syntactic Pattern Recognition to Seismic Discrimination,
Hsi Ho Liu, and King Sun Fu. Aug 81, 26p Rept no. TR-EE81-25
Contract N00014-79-C-0574, Grant NSF-PRF79-06296

Two syntactic methods for the recognition of seismic waveforms are presented in this paper. The seismic waveforms are represented by sentences (strings of primitives). Primitive extraction is based on a cluster analysis. Finite-state grammars are inferred from the training samples. The nearest-neighbor decision rule and error-correcting finite-state parsers are used for pattern classification. While both show equal recognition performance, the nearest-neighbor rule is much faster in computation speed. The classification of real earthquake/explosion data is presented as an application example. (Author)

Prakla-Seismos G.m.b.H., Hanover (Germany, F.R.).
Direct Detection of Hydrocarbons Using Seismic Procedures,
Karl-Otto Millahn, Horst Koitka, Dieter Jurczyk, and Werner S. Jankowsky. Oct 79, 133p BMFT-FB-T-79-31
Trans. of mono. Direkte Erkennung von Kohlenwasserstoffen mit Seismischen Verfahren, n.p., May 78. See also German version, N81-14534. Prepared in cooperation with DEMINEX, German Petroleum Supply Co., Essen.

The aim of this project was to utilize such information about physical properties of the subsurface for a quantitive lithological interpretation as is contained in ampli-

tude, polarity, and frequency content of seismic signals. Methods for determination of amplitudes and spectra of seismic signals were combined to form a reliable and versatile interpretational system which allows an economical, semiautomatic extraction and a spatial presentation of various seismic parameters for lithological studies. An application of the system to an offshore survey area shows clear correlation between high amplitude anomalies and gas zones. Other indicators of hydrocarbons do not show such significant anomalies. Any quantitative interpretation of the results is impeded by complex layering of sandbeds which cannot be resolved by seismic techniques. The reliable lithological interpretation has to be tested by further experimental application to seismic data and has to be supported by petrophysical studies. A method was developed which allows a reliable determination of frequency-dependent attenuation if clear signals, undistorted by interference, are available and if comparatively high minimal attenuation is present. Problems which occur in the application to seismic data are discussed.

Kink Instabilities in Long Ion Layers.
Memorandum rept.,
Douglas S. Harned. 16 Sep 81, 59p Rept no. UCB/ERL-M81/73
Contract N00014-77-C-0578

Kink instabilities in long ion layers immersed in a dense background plasma are studied. A numerical extension of the analytic model of Lovelace indicates that these instabilities will occur for values of the self-magnetic field index below those predicted previously. A quasineutral hybrid simulation code has been used to verify these lower thresholds. The simulations also show that the end of exponential growth occurs due to a nonlinear shift in the betatron frequency at large amplitude, producing an increase in layer thickness and a layer which has many non-axis-encircling ions. X-Ray Backlighting Requirements for the Double-Shell Target.
J. T. Larsen. 26 Aug 80, 15p UCID-18773
Contract W-7405-ENG-48

We have analyzed one specific NOVA double-shell target design and have determined the x-ray energies required for probing the performance of the implosion. It is virtually impossible to study the compression of the fuel or the motion of the inner pusher. An x-ray energy of about 9 keV appears to be ideal for measuring the behavior of the outer TaCOH shell for the majority of its travel. However, it would be advantageous to have an x-ray source of about 25 keV to measure the contact between the two shells. Development of narrowband x-ray line sources are more desirable than broadband continuum sources since the intensity per keV is many times greater in the line. Intensities of the probes are determined by the self-emission levels of the target capsule. For the 9 keV line source, an intensity of upwards to 10 exp 15 keV/keV/sh/cm exp 2 /sr is required with a source area of about 0.01 cm exp 2 . (ERA citation 06:035750)

Review of Melting and Evaporation of Fusion-Reactor First Walls.
J. A. Fillo, and H. Makowitz. 1981, 8p BNL-29826, CONF-811101-10
Contract AC02-76CH00016
Winter annual meeting of the ASME Technology and Society Division, Washington, DC, USA, 15 Nov 1981.

The most severe thermal loading on the first wall will occur when the plasma becomes unstable resulting in a hard plasma disruption or at the end of a discharge when the plasma is dumped on the wall in a very short period of time. Hard plasma disruptions are of particular concern in future fusion reactors where the thermal energy of the plasma may reach values on the order of 300 MJ. Sufficiently high heating rates can occur to melt the first wall surface, and the temperature can increase resulting in vaporization. Thermal models are reviewed which treat these problems. High-beta Studies with Beam-Heated, Non-Circular Plasmas in ISX-B.
E. A. Lazarus, S. C. Bates, and C. E. Bush. 1981, 5p CONF-810906-10
Contract W-7405-ENG-26
10. European conference on controlled fusion and plasma physics, Moscow, USSR, 14 Sep 1981.

In this paper we describe some preliminary results of high beta studies on ISX-B for mildly D shaped discharges. ISX-B is a modest size tokamak (R sub 0 = 93 cm, a = 27 cm) equipped with two tangentially-aligned neutral beam injectors giving a total power up to 3 MW. The poloidal coil system allows choice of plasma boundary shapes from circular to elongated (kappa less than or equal to 1.8), with D, elliptical, or inverse D cross sections. The non-circular work discussed here is for kappa approx. = 1.5. (ERA citation 06:035698)

Monte Carlo Simulation of Molecular Flow in a Neutral-Beam Injector and Comparison with Experiment.
R. A. Lillie, T. A. Gabriel, S. W. Schwenterly, R. G. Alsmiller, Jr., and R. T. Santoro. Sep 81, 30p ORNL/TM-7911
Contract W-7405-ENG-26

Monte Carlo calculations have been performed to obtain estimates of the background gas pressure and molecular number density as a function of position in the PDX-prototype neutral beam injector which has undergone testing at the Oak Ridge National Laboratory. Estimates of these quantities together with the transient and steady-state energy deposition and molecular capture rates on the cryopanels of the cryocondensation pumps and the molecular escape rate from the injector were obtained utilizing a detailed geometric model of the neutral beam injector. The molecular flow calculations were performed using an existing Monte Carlo radiation transport code which was modified slightly to monitor the energy of the background gas molecules. The credibility of these calculations is demonstrated by the excellent agreement between the calculated and experimentally measured background gas pressure in front of the beamline calorimeter located in the downstream drift region of the injector. The usefulness of the calculational method as a design tool is illustrated by a comparison of the integrated beamline molecular density over the drift region of the injector for three modes of cryopump operation. Stable Heating and Burn Simulations of a Reversed-Field Pinch Reactor.
R. W. Moses, Jr., R. A. Nebel, and G. H. Miley. 1980, 7p CONF-800948-1
Contract W-7405-ENG-36
Joint Grenoble-Varenna international symposium on heating in toroidal plasmas, Grenoble, France, Sep 1980.

The reversed-field pinch provides three significant advantages as a fusion reactor: it can be ohmically heated, it operates at high beta , and it is not restricted to a small aspect ratio. Experimentally, the best understood startup scenarios are self reversal, aided reversal and fast-field programming. On the basis of results from a one-dimensional transport and stability code, an ideal MHD stable startup and burn procedure is described in this paper. Pitch programming and a gas

feed at the wall are used. This adiabatic startup is characterized by a high pitch near the minor axis and hollow current and pressure profiles. Ideally, it would be possible to have a reactor startup and burn without highly turbulent processes to deposit excessive amounts of energy on the wall. Potential problems of resistive instabilities and plasma-wall interactions are discussed. (ERA citation 05:034415)

First Wall Magnetic Protection in an Inertially Confined Thermonuclear Reactor.
J. J. Devaney. May 80, 27p
Contract W-7405-ENG-36

On the basis of three different theories, it is shown for a typical set of reactor parameters that inertially confined microexplosions are either (1) stable during early expansion; or (2) only weakly unstable during expansion with flute amplitude growth of but 0.005%; or (3) only weakly unstable during expansion with negligible flute amplitude growth. Simple formulas are given for skin depths in the plasma (approx. 0.3 cm for 500 exp 0 C graphite). Plasma behavior is found to be collective and ambipolar. Formulas are given for calculating the strength of the required protecting initial magnetic field. For a microexplosion putting 16-MJ kinetic energy into 0.25 g of lead debris, we find 3.2 kG to be adequate protection in a reactor chamber of 200-cm radius with a graphite (or other conducting) wall. Boosting Up of Neutral Beam Heating Power by Slowly Rising Toroidal Field.
R. Y. Lin, K. Hirano, M. Okamoto, K. Shimizu, and T. Amano. Aug 81, 33p IPPJ-534

A system of 1-D transport codes combined with Fokker-Planck codes was used to simulate plasmas undergoing compression with beam injection for the 'R-Project Tokamak'. The impurity radiation is not included. The numerical model contains the neoclassical transport including the Ware pinch, empirical anomalous particle and electron heat transports based on the Alcator scaling, and neutral particle transport. The combination results are very encouraging. They show that by sinusoidally increasing the toroidal magnetic field and the plasma current simultaneously, it is possible to significantly increase the temperature with a very slow compression. The final ion temperature is very weakly dependent on the compression time from 0.5 sec to 1 sec for the 'R-Project Tokamak'. If the 'R-Project Tokamak' plasma is compressed by sinusoidally increasing the magnetic field and plasma current simultaneously, then the beam power which is necessary to obtain an average ion temperature of keV without compression 15 MW can be decreased to 8.5 MW.

Tokamak Blanket Design Study, Final Report.
Aug 80, 192p
Contract W-7405-ENG-26

A cylindrical module concept was developed, analyzed, and incorporated in a tokamak blanket system that includes piping systems, vacuum boundary sealing, and support structures. The design is based on the use of state-of-the-art structural materials (20% cold-worked type 316 stainless steel), lithium as the breeding material, and pressurized helium as the coolant. The module design consists of nested concentric cylinders (with an outer diameter of 10 cm) and features direct wall cooling by helium flowing between the outer (first-wall) cylinder and the inner (lithium-containing) cylinder. Each cylinder can withstand full coolant pressure, thus enhancing reliability. Results show that stainless steel is a viable material for a first wall subjected to a neutron wall loading of 4 MW/m exp 2 and a particle heat flux of 1 MW/m exp 2 . Lifetime analysis shows that the first-wall design meets the goal of operating at 20-min cycles with 95% duty for 100,000 cycles. To reduce system complexity, a larger 20-cm-diam module also was analyzed for incorporation in the blanket assembly. Reliability assessment indicates that it may be possible to double the module in size from 10 to 20 cm in diameter. With a modest increase in coolant pumping power, a blanket assembly comprising 20-cm-diam modules can still achieve 100,000 operating cycles - equivalent to a 3.6-year design lifetime - with only one or two helium coolant leaks into the plasma. Calculation of Neutron and gamma Ray Energy Spectra for Fusion Reactor Shield Design: Comparison with Experiment.
R. T. Santoro, R. G. Alsmiller, Jr., J. M. Barnes, and G. T. Chapman. Aug 80, 42p
Contract W-7405-ENG-26

Integral experiments that measure the transport of approx. 14 MeV D-T neutrons through laminated slabs of proposed fusion reactor shield materials have been carried out. Measured and calculated neutron and gamma ray energy spectra are compared as a function of the thickness and composition of stainless steel type 304, borated polyethylene, and Hevimet (a tungsten alloy), and as a function of detector position behind these materials. The measured data were obtained using a NE-213 liquid scintillator using pulse-shape discrimination methods to resolve neutron and gamma ray pulse height data and spectral unfolding methods to convert these data to energy spectra. The calculated data were obtained using two-dimensional discrete ordinates radiation transport methods in a complex calculational network that takes into account the energy-angle dependence of the D-T neutrons and the nonphysical anomalies of the S/sub n/ method. 180. American Chemical Society meeting/2. chemical congress of the North American Continent, Las Vegas, NV, USA, 24 Aug 1980, Portions of this document are illegible.

Americium recovery was initiated at Los Alamos Scientific Laboratory (LASL) in the late 1940's. The early procedures separated gram quantities of americium from large amounts of impurities including plutonium and the rare earths. Ion exchange procedures were developed for further purification. Until recently, no routine processing of americium has been done at LASL for several years. The increasing demand for americium in oil-well logging instruments and other uses led LASL to develop and install a process to recover larger quantities of americium. The LASL process was developed around the chemistry of americium that had been elucidated both at LASL and at other facilities. Presently, the americium feed is obtained as a by-product from a plutonium purification process at the new plutonium facility at LASL. This feed filtrate from a peroxide precipitation process is precipitated as a slurry of hydroxides, filtered, dissolved in nitric acid, and passed through an anion exchange column to remove any residual plutonium. The americium, contained in the effluent, is precipitated as the oxalate and calcined to the oxide. Americium is also available in other highly salted acidic process streams. These should lend themselves to solvent extraction. Developmental work has been promising, and a dibutyl butyl phosphate-kerosene extraction process is being brought on-line. The Underwater Acoustic Signature of a Nuclear Explosion at the Ocean Surface.
Interim technical rept.,
T. C. Bache, T. G. Barker, M. G. Brown, K. D. Pyatt, and H. J. Swanger. Jul 80, 32p SSS-R-80-4586, VSC-TR-81-24
Contract F08606-79-C-0008, ARPA Order-2551

The gross spectral character and duration of the acoustic wave signature of a nuclear explosion near the ocean surface is estimated by constructing theoretical pressure-time histories, using models for the explosion and wave propagation. The explosion is assumed to have a yield of 1 KT and the nominal range is 6600 km. The frequencies of interest are rather low, 50 Hz and less, so absorption is small and the estimates of spectral character and duration essentially decouple. The spectrum depends almost entirely on the source characteristics and the duration is controlled by characteristics of the travel path. The airblast-induced pressure loading on the ocean surface dominates the source, with the acoustic waves from direct coupling into the water being relatively small. At large distances, the spectrum for 1 KT peaks near 20 Hz and is band-limited between 5 and 50 Hz. For different energy yields these frequencies scale with the cube-root of the yield. Different assumptions about the (laterally homogeneous) oceanic sound profile lead to differing estimates for the signal duration. Values of 20 to 60 seconds seem most reasonable. (Author)

Calculated Response of Intrinsic Germanium Detectors to Narrow Beams of Photons with Energies Up to Approximately 300 keV.
Final rept.,
Stephen M. Seltzer. 1981, 19p
Pub. in Nuclear Instruments and Methods 188, p133-151 1981.

The response of small intrinsic Ge detectors has been calculated for photons incident with energies up to about 300 keV. The results include the effects of scattering and escape from the detector of the photons and of Ge characteristic X-rays produced in photoelectric absorption. Included also are the effects of the backscattering of photons from material behind the detector. The results, based on Monte Carol calculations for various photon energies and detector sizes, have been generalized on the basis of a single-scatter model and are given as a set of formulae that can be evaluated for any photon energy and detector size in the range of interest. The formulae are used to tabulate photopeak efficiencies for a large number of commercially available detectors, and to generate response functions for unfolding measured pulse-height distributions obtained for continuous incident spectra.

The Graphite Calorimeter as a Standard of Absorbed Dose for Cobalt-60 Gamma Radiation,
John S. Pruitt, Steve R. Domen, and Robert Loevinger. 6 May 81, 8p
Included in Jnl. of Research of the National Bureau of Standards, v86 n5 p495-502, Sep-Oct 81.

Absorbed dose to water in a cobalt-60 gamma-ray beam has been determined using a thick-walled graphite ionization chamber. The chamber was calibrated in a graphite phantom against a graphite calorimeter, and the graphite calibration factor was converted to a water calibration factor using published energy absorption coefficient ratios and a measured replacement factor. Comparisons between the graphite and water measurements were made at pairs of points that were scaled in position according to the ratio of electron densities, so that the photon spectra were the same for the two points in a given pair. Measurements performed in graphite over a wide range of phantom depths, field sizes, and source distances, showed that the calibration factor varies slowly with the phantom depth and field size, and probably has a negligible dependence on source distance. By comparison with the thick-walled chamber in a cobalt-60 gamma-ray beam, a secondary ionization chamber can be calibrated in terms of absorbed dose to water with an estimated uncertainty of about + or - 1 percent.

Greater Commitment Needed to Solve Continuing Problems at Three Mile Island.
Report to the Congress.
26 Aug 81, 121p Rept no. GAO/EMD-81-106

The Nation's first major accident at a commercial nuclear-powered electricity generating station occurred at Three Mile Island over 2 years ago, yet the resolution of the resultant problems is still subject to regulatory and financial uncertainty. Consequently, little progress has been made to clean up the damaged facility or alleviate the extreme financial stress placed upon its owners. The remedies required to resolve the continuing problems at Three Mile Island will require unprecedented coordination and commitment by Federal and State regulatory bodies, the electric utility industry, the financial community, and the owners of the damaged facility. To safeguard against similar problems in the future, the Nuclear Regulatory Commission should develop accident recovery guidelines and ensure that increased property insurance coverage is available for nuclear facilities. Congress Should Increase Financial Protection to the Public from Accidents at DOE Nuclear Operations.
14 Sep 81, 27p Rept no. GAO/EMD-81-111

Since the Federal Government is still committed to fostering private industry involvement in nuclear energy, and since alternative methods for insuring the public against the potential hazards of a catastrophic nuclear accident do not provide as much financial protection as does the Price-Anderson Act, we believe that the financial protection provided DOE-contractor operations is still needed. Differences in the treatment of DOE-contractor operations under the Price-Anderson Act, however, serve to provide less financial protection to the public against losses from nuclear accidents from DOE-contractor operations than from licensed commercial activities. Because DOE contractors are covered by only one layer of financial protection, current coverage is $60 million lower than for commercial licensees. Thus, the public may not be equally compensated if damages exceed $500 million. Further, as more commercial reactors are licensed to operate and the limit on liability rises on the commercial side, this gap in coverage will widen. In our opinion, public financial protection should be consistently applied, regardless of who is performing the nuclear activity.

Nuclear Reactor Maintenance Technology Assessment. Final Summary Report, September 16, 1978-September 15, 1979.
D. Tesar, M. J. Ohanian, and E. T. Dugan. 18 Jul 80, 95p DOE/OR/06102-T1
Contract AS05-78OR06102

Nuclear power plants have exhibited a downtime of one day in four during the past decade. For mature LWR plants, 40% of this downtime is due to forced (unexpected) outages. These outages increase the loss of revenues and increase occupational radiation exposure. In 1979, the cost of maintenance of 70 operating plants was $1 billion per year. A fully remote maintenance technology would save 70% of this cost. PWR steam generator maintenance under fully remote system technology could save $270 million a year. BWR valve maintenance with fully remote technology could save $54,000,000 a year. Benefits for 150 plants by the early 1990's would be substantially higher; the total yearly savings would amount to $1.8 billion. The PWR steam generator would save $550 million while the BWR valve problem would save $140 million. For nuclear power plant maintenance, the vendors initially took steps to redesign and improve the reliability of the reactor system. The second step was to develop special maintenance tooling. The development of a generalized robotic manipulator having greater precision, dexterity, reliability, obstacle avoidance capability and load capacity is now feasible using microelectronics and computers. In order to drive this more general slave, the master controller must also be generalized to create a man-machine interface as transparent as possible; software modules must be developed which filter jitter, change scales, automaticaly control vision systems, and adapt force feedback signals in order to enhance the speed and precision of operation of the total system. A full complement of component technologies such as sensors, actuators, end-effectors, and remote TV vision systems must also be developed. Several other energy systems represent operations where such remote systems technology may be valuable. (ERA citation 81:025499)

HTGR-GT Closed-Cycle Gas Turbine: A Plant Concept with Inherent Cogeneration (Power Plus Heat Production) Capability.
C. F. McDonald. Apr 80, 10p CONF-800806-14
Contract AT03-76SF70046
15. intersociety energy conversion engineering conference, Seattle, WA, USA, 18 Aug 1980.

The high-grade sensible heat rejection characteristic of the high-temperature gas-cooled reactor-gas turbine (HTGR-GT) plant is ideally suited to cogeneration. Cogeneration in this nuclear closed-cycle plant could include (1) bottoming Rankine cycle, (2) hot water or process steam production, (3) desalination, and (4) urban and industrial district heating. This paper discusses the HTGR-GT plant thermodynamic cycles, design features, and potential applications for the cogeneration operation modes. This paper concludes that the HTGR-GT plant, which can potentially approach a 50% overall efficiency in a combined cycle mode, can significantly aid national energy goals, particularly resource conservation. Customers in the European Community countries should apply to the Office for Official Publications of the European Communities, B.P. 1003, Luxembourg.

The use of fault tree techniques has been widely explored to study the risks and reliability of nuclear reactors. This analysis identifies situations in which the conventional AND-OR system is thought to be insufficient and the inclusion of a NOT function is necessary. Various examples are examined to show that exact analysis requires the determination of the minimal, irredundant base of the Boolean function. However, in many cases the method can be simplified by opting for either of two approaches which permit the reduction of complete fault trees to AND-OR structures. This permits bounds to be set to the probability of specific top events occurring within a given time, when the hypothesis of structure function monotonicity is removed.

RSM Development for Nuclear Safety Analysis. A Test Problem,
A. Amendola, F. Argentesi, M. Astolfi, S. Canali, and B. Lisanti. c1981, 38p EUR-7031-EN
Customers in the European Community countries should apply to the Office for Official Publications of the European Communities, B.P. 1003, Luxembourg.

Safety analysis of nuclear plants demands the running of complex simulation computer programs to provide probability distribution functions of particular outcomes. Response surface methodology (RSM) is a technique for simplifying the analysis by giving the information in the form of a simple function. This approach has been applied to safety analysis methods. An analytical function (14-variable polynomial) was used in place of the simulation program and its performance was analyzed by RSM. The results were satisfactory for a centrally distributed probability function, but less effective for uniform or lateral distributions. It is necessary to determine whether different designs or whether an adequate distribution can be found.

Contract AC04-76DP00789
ANS winter meeting, San Francisco, CA, USA, 29 Nov 1981.

The following conclusions were drawn from this study: casks over 9100 kg in mass and their restraining systems can be considered rigid in the vertical direction for the lower modes of vibration. Vehicle bed accelerations for truck transportation system vary significantly from system to system. Vehicle bed accelerations of additional systems need to be measured before a general design guide can be provided. Simple, cost efficient tests are being conducted that will provide the data necessary for adequate guidance to the design of tie-downs for large shipping containers. (ERA citation 06:035324)

Development of Analytical Tools for the Punch Investigation of the Transuranic Package Transporter (TRUPACT).
S. H. Sutherland, and T. A. Duffey. May 81, 58p SAND-80-1879
Contract AC04-76DP00789

Methods of simplified analysis are presented for the evaluation of the punch resistance of the TRUPACT sidewalls. The first method consists of an elastic analysis of a foam-backed triangular plate. This analysis, which accurately models the geometry of the TRUPACT sidewall (though not the material behavior) is then used to evaluate the influence of the particular location on the sidewall where the punching is taking place. The second method consists of a plastic membrane analysis of a circular plate in which both the plate material and foam backing exhibit plastic behavior. In this analysis, the material behavior of the TRUPACT is accurately modeled, whereas the geometry is not. This analysis is used to estimate the minimum thickness of the foam-backed outer skin required to prevent its perforation. (ERA citation 06:035321)

Transportation of Radioactive Material in South Carolina.
Surveillance study Oct 79-Sep 80.
Nov 81, 29p
See also PB-286 866. Sponsored in part by Department of Transportation, Washington, DC.

The report describes the third year's study by the State of South Carolina of the transportation of radioactive materials in South Carolina, during the period, October 1, 1979 to September 30, 1980. The study was performed under contract to the Nuclear Regulatory Commission and the Department of Transportation. Low-level radioactive waste represents the largest portion of radioactive material transported in the State due to the commercial low-level radioactive waste facility at Barnwell, SC. The study has shown that violations of applicable Federal and State regulations persist; however, the health and safety of the public and of waste handlers has not been compromised as a result of these shipments. The study recommends that these shipments continue to be monitored and that strict enforcement actions be taken against violators. Also, more training is recommended for persons associated with handling and transporting radioactive materials.

Mockup Testing of Remote Systems for Zirconium Fuel Dissolution Process at the Idaho Chemical Processing Plant.
D. M. Paige. 1979, 28p
Contract EY-76-C-07-1570
American Nuclear Society meeting, San Francisco, CA, USA, 12 Nov 1979.

A facility is being constructed at the Idaho National Engineering Laboratory for storage and dissolution of spent zirconium reactor fuels. The dissolution is carried out in chemical type equipment contained in a large shielded cell. The design provides for remote operations and maintenance as required. Equipment predicted to fail within 5 years is designed for remote maintenance. Each system was fabricated for mockup testing using readily available materials. The mockups were tested, redesigned, and retested until satisfactory remote designs were achieved. Records were made of all the work. All design changes were then incorporated into the ongoing detailed design for the actual equipment. Several of these systems are discussed and they include valve replacement, pump replacement, waste solids handling, mechanism operations and others. The mockup program has saved time and money by eliminating many future problems. In addition, the mockup program will continue through construction, cold startup, and hot operations. Experimental Source Term Data Base for Assessing the Safety of Spent Fuel Transportation.
R. P. Sandoval, M. G. Vigil, and G. J. Newton. 1981, 5p SAND-81-1188C, CONF-811103-5
Contract AC04-76DP00789
ANS winter meeting, San Francisco, CA, USA, 29 Nov 1981.

This paper deals with a program currently underway at Sandia National Laboratories (SNL) to characterize source term aerosols produced from exposing spent fuel transport systems to extraordinary environments and to produce improved estimates of environmental and health consequences. The extreme environments of interest have been divided into two categories: those related to explosive attack and those related to extra-severe accidents. Efforts in this program to date have concentrated on the development of an experimental data base characterizing the release of radioactive material (i.e. source terms) resulting from explosive attacks on spent fuel casks. This experimental data base is the primary input to an analysis of the human health and economic consequences. (ERA citation 06:034364)

DPSPU-80-30-9, CONF-810404-2
Contract AC09-76SR00001
American Welding Society conference, Cleveland, OH, USA, 6 Apr 1981.

Various methods are being investigated for permanent disposal of high level nuclear wastes. In one process the waste is incorporated in molten glass and poured into type 304-L stainless steel canisters which provide the first layer of a multilayer containment system. Upset welding was selected as the process best suited for sealing the fill hole in the canister since this process is amenable to use in a remotely operated facility. Welding paramters are readily controlled and dynamically recorded during the course of the weld. Weld quality can be controlled and assessed through control of the process. The process was shown to be suitable for producing welds up to 5 in. (127 mm) in diameter and having 0.38-in. (9.5 mm) throat thickness. Weld current of 230,000 A AC, electrode force of 75,000 lb (333,600 N), and weld time of 2.0 seconds were required for a 5-in. (127 mm) diameter weld. The welds have a wrought structure and the tensile strength of the weld metal equals or exceeds that of the annealed base material. The size weld that can be produced appears limited only by the ability to provide sufficient welding current. A welder designed to deliver 400,000 A DC is being installed in a nonradioactive nuclear waste pilot facility. (ERA citation 06:034377)

Draft Environmental Impact Statement: Defense Waste Processing Facility, Savannah River Plant, Aiken, SC.
Sep 81, 456p DOE/EIS-0082D

The purpose of this Environmental Impact Statement (EIS) is to provide environmental input into both the selection of an appropriate strategy for the permanent disposal of the high-level radioactive waste (HLW) currently stored at the Savannah River Plant (SRP) and the subsequent decision to construct and operate a Defense Waste Processing Facility (DWPF) at the SRP site. The SRP is a major US Department of Energy (DOE) installation for the production of nuclear matrials for national defense. Approximately 83 x 10 exp 3 m exp 3 (22 million gal) of HLW currently are stored in tanks at the SRP site. The proposed DWPF would process the liquid HLW generated by SRP operations into a stable form for ultimate disposal. This EIS assesses the effects of the proposed immobilization project on land use, air quality, water quality, ecological systems, health risk, cultural resources, endangered species, wetlands protection, resource depletion, and regional social and economic systems. The radiological and nonradiological risks of transporting the immobilized wastes are assessed. The environmental impacts of disposal alternatives have recently been evaluated in a previous EIS and are therefore only summarized in this EIS. (ERA citation 06:034398)

Preliminary Technical Data Summary for the Defense Waste Processing Facility, Stage 1.
Sep 80, 213p DPSTD-80-38
Contract AC09-76SR00001

This Preliminary Technical Data Summary presents the technical basis for design of Stage 1 of the Staged Defense Waste Processing Facility (DWPF), a process to efficiently immobilize the radionuclides in Savannah River Plant (SRP) high-level liquid waste. The radionuclides in SRP waste are present in sludge that has settled to the bottom of waste storage tanks and in crystallized salt and salt solution (supernate). Stage 1 of the DWPF receives washed, aluminum dissolved sludge from the waste tank farms and immobilizes it in a borosilicate glass matrix. The supernate is retained in the waste tank farms until completion of Stage 2 of the DWPF at which time it filtered and decontaminated

by ion exchange in the Stage 2 facility. The decontaminated supernate is concentrated by evaporation and mixed with cement for burial. The radioactivity removed from the supernate is fixed in borosilicate glass along with the sludge. This document gives flowsheets, material, and curie balances, material and curie balance bases, and other technical data for design of the Stage 1 DWPF. (ERA citation 06:034378)

Socioeconomic Assessment of Defense Waste Processing Facility Impacts in the Savannah River Plant Region.
E. Peelle, J. H. Reed, and R. H. Stevenson. Sep 81. 138p ORNL/TM-7893
Contract W-7405-ENG-26

The DWPF will immobilize highly radioactive defense wastes for storage on site until shipment to an approved federal repository for radioactive wastes. This document assesses the socioeconomic impacts of constructing and operating the proposed facility and presents the assessment methodology. Because various schedules and various ways of staging the construction of the DWPF are considered and because in some of these instances a large nearby construction project (the Vogtle Nuclear Power Station) may influence the socioeconomic impacts, four scenarios involving different facility options and schedules are assessed. In general, the impacts were found not to be large. In the scenario where the socioeconomic effects were the greatest, it was found that there are likely to be some impacts on schools in Barnwell County as well as a shortage of mobile homes in that county. Aiken, Allendale, and Bamberg counties are also likely to experience slight-to-moderate housing shortages. Minor impacts are anticipated for fire and police services, roads, traffic, and land use. There will be noticeable economic impact from the project. Other scenarios had fewer socioeconomic impacts. (ERA citation 06:035470)

Survey of Matrix Materials for Solidified Radioactive High-Level Waste.
W. E. Gurwell. Sep 81, 58p PNL-3512
Contract AC06-76RL01830

Pacific Northwest Laboratory (PNL) has been investigating advanced waste forms, including matrix waste forms, that may provide a very high degree of stability under the most severe repository conditions. The purpose of this study was to recommend practical matrix materials for future development that most enhance the stability of the matrix waste forms. The functions of the matrix were reviewed. Desirable matrix material properties were discussed and listed relative to the matrix functions. Potential matrix materials were discussed and recommendations were made for future matrix development. The matrix mechanically contains waste cores, reduces waste form temperatures, and is capable of providing a high-quality barrier to leach waters. High-quality barrier matrices that separate and individually encapsulate the waste cores are fabricated by powder fabrication methods, such as sintering, hot pressing, and hot isostatic pressing. Viable barrier materials are impermeable, extremely corrosion resistant, and mechanically strong. Three material classes potentially satisfy the requirements for a barrier matrix and are recommended for development: titanium, glass, and graphite. Polymers appear to be marginally adequate, and a more thorough engineering assessment of their potential should be made. (ERA citation 06:034384)

Summary of the Engineering Assessment of Inactive Uranium Mill Tailings, Riverton Site, Riverton, Wyoming.
Aug 81, 57p DOE/UMT-0106S, FBDU-360-19S
Contract AC04-76GJ01658

Ford, Bacon, and Davis Utah Inc. has reevaluated the Riverton site in order to revise the December 1977 engineering assessment of the problems resulting from the existence of radioactive uranium mill tailings at Riverton, Wyoming. This engineering assessment has included the preparation of topographic maps, the performance of core drillings and radiometric measurements sufficient to determine areas and volumes of tailings and radiation exposures of individuals and nearby populations, the investigations of site hydrology and meteorology, and the evaluation and costing of alternative corrective actions. Radon gas released from the 900,000 tons of tailings materials at the Riverton site constitutes the most significant environmental impact, although windblown tailings and external gamma radiation also are factors. The nine alternative actions presented in this engineering assessment range from millsite decontamination with the addition of 3 m of stabilization cover material (Option I), to removal of the tailings to remote disposal sites and decontaminations of the tailings site (Options II through IX). Cost estimates for the nine options range from about $16,600,000 for stabilization in-place, to about $23,200,000 for disposal at a distance of 18 to 25 mi. Three principal alternatives for the reprocessing of the Riverton tailings were examined: (a) heap leaching; (b) treatment at an existing mill; and (c) reprocessing at a new conventional mill constructed for tailings reprocessing. The cost of the uranium recovered would be about $260 and $230/lb of U sub 3 O sub 8 by heap leach and conventional plant processes respectively. The spot market price for uranium was $25/lb early in 1981. Therefore, reprocessing the tailings for uranium recovery does not appear to be economically attractive. (ERA citation 06:034375)

Environmental and Other Evaluations of Alternatives for Long-Term Management of Buried INEL Transuranic Waste.
Dec 79, 527p
Contract EY-76-C-07-1570

This study identifies, develops, and evaluates, in a preliminary manner, alternatives for long-term management of the TRU waste buried at the RWMC at the INEL. The technology required for managing the waste, the environmental effects, the risks to the public, the radiological and nonradiological hazards to workers, and the estimated costs are discussed. The RWMC was established in the southwestern corner of the INEL in 1952 as a controlled area for burial of solid radioactive waste generated by INEL operations. It encompasses about 144 acres. Since 1954, solid waste contaminated with transuranic radionuclides has been received from defense-related activities at the RFP and from other operations of the AEC and its successor agencies. Approximately 2,200,000 ft exp 3 of TRU waste was buried in pits and trenches at the RWMC between 1954 and 1970. Since 1970, about 1,100,000 ft exp 3 of TRU waste has been received and stored retrievably on aboveground asphalt pads at the RWMC. The containers (metal bins and drums and wooden boxes) for the stored waste are generally in good condition. However, the containers for the buried waste have deteriorated badly; some of the waste, such as large pieces of equipment, was buried without containers. Some of the soil immediately adjacent to the buried waste has become contaminated. Six alternatives for the long-term management of the buried TRU waste were studied. These alternatives are identified and concepts within these alternatives developed and evaluated. (ERA citation 05:011346)

Low-Level Transuranic Waste Assay by Photon Interrogation and Moderated Neutron Counting.
M. R. Cates, L. A. Franks, B. W. Noel, J. L. Pigg, and D. A. Close. Oct 79, 17p
Contract W-7405-ENG-36

When fission is induced in trace amounts of transuranic contaminants in waste material, it provides signatures from fission products that can be used to assay the material before disposal. Given here are the results from counting photofission-induced delayed neutrons from exp 239 Pu in sample matrices. When delayed neutrons emitted after 5 min of photon irradiation with energies up to 18 MeV in 1-l samples are counted, assay limits of 10 to 100 nCi/g for matrices with a density of up to 5 g/cm exp 3 are determined. Counting all delayed neutron emissions or some prompt neutrons improves sensitivities by a factor of 20 or more. The dynamics of photofission and delayed neutron production, use of an electron linear accelerator as a particle source, experimental and electronic details, and future experimental plans are discussed. 15 figures, 3 tables. Nuclear Waste Management Technology Development Activities. Progress Report, January-December 1978.
L. J. Johnson, and B. H. Desilets. Jun 79, 73p
Contract W-7405-ENG-36

Summary reports describe progress in Los Alamos Scientific Laboratory (LASL) Health Research Division managed programs by the nuclear waste management task area for calendar year (CY) 1978. Development and application of assay instrumentation for measuring the radioactivity content of waste packages is report-

ed. Work in developing test materials and laser-based instrumentation for in-place testing of high-efficiency particulate aerosol filters is discussed. Development and demonstration of a controlled air incinerator for treatment of radioactively contaminated combustible waste is described. Field data from the environmental geology and hydrology aspect of shallow earth disposal of radioactively contaminated waste are reviewed and related to improvement of land burial technology. (ERA citation 05:002595)

CONF-800507-7(Rev.)
Contract W-7405-ENG-48
Rock mechanics symposium, Rolla, MO, USA, 27 May 1980.

Comparisons were made between predicted and measured thermomechanical displacements and stresses for in situ heating experiments at a depth of 340 m in a granite body at Stripa, Sweden. We found that taking into account the temperature dependence of the thermal expansion coefficient and the mechanical properties of the rock substantially improves the agreement between theory and experiment. In general, the displacements calculated using laboratory values of rock properties agree better with field data than in the case of stresses. This may be due to the difference between in situ and laboratory rock modulus. The significance of temperature-dependent rock properties and strength to thermomechanical failure is also discussed. (ERA citation 05:026986)

Durability of Simulated Supercalcine Ceramics at Geologic Storage Conditions.
Final rept.,
M. W. Phillips, A. I. Kilinc, Kwo-Ling Chyi, J. W. Shade, and E. L. Wegert. Nov 81, 169p

Two simulated high Na supercalcines, SPC-7a-2 and SPC-8a-5, have been studied. The apatite, spinel and corundum phases were confirmed in SPC-8a-5 as well as an amorphous phase containing Si, Al, Ca, Fe, and Na. Other phases tentatively identified include scheelite, nepheline, ZrO2 and Cs-molybdate. No pollucite was found perhaps because of excessive waste loading and/or inappropriate firing of calcine/additive mixture. Hydrothermal experiments were performed at 300, 400 and 500 C and 1Kb pressure on supercalcine and supercalcine/basalt using deionized water and 0.1, 0.5, and 1.0M NaCl solutions. The apatite, spinel and corundum phases showed extensive development of crystal faces during hydrothermal treatment. The Cs-molybdate and amorphous phases disappeared. New phases produced include acmite, Cs-analcime, Ba aluminosilicate and perhaps powellite. Two types of diffusion experiments were performed on supercalcine and host rocks (basalt, granite and shale) employing a 300C/cm gradient. Results indicate that concentration gradient is the most important factor controlling waste component mobility followed by temperature gradient. Three theoretical models are presented to predict component migration (concentration vs. distance) as a function to time.

Analysis of Space Systems Study for the Space Disposal of Nuclear Waste Study Report. Volume 2: Technical Report.
Final Report.
1981, 360p NASA-CR-161888, D180-26426-2-V-2
Contract NAS8-33847

Reasonable space systems concepts were systematically identified and defined and a total system was evaluated for the space disposal of nuclear wastes. Areas studied include space destinations, space transportation options, launch site options payload protection approaches, and payload rescue techniques. Systems level cost and performance trades defined four alternative space systems which deliver payloads to the selected 0.85 AU heliocentric orbit destination at least as economically as the reference system without requiring removal of the protective radiation shield container. No concepts significantly less costly than the reference concept were identified.

Public Information on Radioactive Waste: A Study of an Emerging Issue.
L. M. Bronfman, B. H. Bronfman, and J. L. Regens. Oct 79, 59p
Contract W-7405-ENG-26

Through an analysis of information provided in the printed media on the topic of radioactive waste, the study analyzes the emergence of radioactive waste as a public issue in the press. Over eight hundred articles printed in both specialized and non-specialized sources from 1973 to 1978 have been content-analyzed in order to describe how the problem of radioactive waste is defined and what dimensions of the problems are receiving attention. Between 1973 and 1978, there was a substantial increase in the amount of information on the topic of radioactive waste available to the public through a variety of popular and specialized media sources. This increase coincides with documented public concern with the problem of radioactive waste. Discussions of radioactive waste have focused for all sources more frequently on themes not directly related to the technical problems of radioactive waste storage or isolation. A substantial amount of the information available to a variety of segments of the public is composed of discussions of real or perceived risk related to the existence of waste or to methods of disposing of it. In addition to risk, a substantial proportion of the discussions deal with institutional themes. Over time, the total amount of information on most dimensions of the radioactive waste problem has increased substantially. Institutional themes have gained relative to other issues over the three time periods. National and local press sources infrequently specify the form of waste being discussed thus providing evidence that the quality of technical information available to some members of the public is very low. State of the ART Review of Alternatives to Shallow Land Burial of Low Level Radioactive Waste.
Apr 80, 101p
Contract W-7405-ENG-26

A review of alternatives to shallow land burial for disposal of low level radioactive waste was conducted to assist ORNL in developing a program for the evaluation, selection, and demonstration of the most acceptable alternatives. The alternatives were categorized as follows: (1) near term isolation concepts, (2) far term isolation concepts, (3) dispersion concepts, and (4) conversion concepts. Detailed descriptions of near term isolation concepts are provided. The descriptions include: (1) method of isolation, (2) waste forms that can be accommodated, (3) advantages and disadvantages, (4) facility and equipment requirements, (5) unusual operational or maintenance requirements, (6) information/technology development requirements, and (7) related investigations of the concept. Work on the geological disposal of radioactive waste in salt domes carried out in the Netherlands during 1978-79 is reviewed. Work undertaken since then is reported in four annexes. Annex 1 describes the development of a model to predict the consequences of radioactive release following accidental flooding of a repository for vitrified high-level waste in a salt dome. Annex 2 analyzes the minimum and maximum rock salt temperatures in different configurations and recommends a study of the effect of thermal expansion. Annex 3 provides details of the design and construction of a salt-dome repository for nuclear wastes, including the sinking and construction of the shafts underground, haulage, ventilation, and the different plugging and sealing procedures for the disposal boreholes and the shafts. Annex 4 contains a description of a borehole drilling experiment carried out with air flushing in the Asse II salt mine.

Charged Particle Simulation of Fast Neutron Damage.
Final rept. 1 Jan 76-31 Oct 81,
W. J. Choyke, J. A. Spitznagel, and R. M. More. 22 Oct 81, 69p Rept no. 81-9F3-SIMFN-R1
Contract N00014-76-C-0482

The motivation of this work is to compare atomic damage configurations associated with neutron and fast-ion damage. The question we set out to answer was: Which choice of ion mass and kinetic energy provides the best simulation of fast neutron damage. The answer which emerges is that the primary damage state, i.e. the statistical distribution of free defects, and subcascade regions before annealing, is remarkably independent of the ion species and its PKA spectrum. Experimentally single crystals of Mo were bombarded with 86Kr, 20Ne, 11B, 4He, and 1H in such a manner that the energy deposited into elastic collisions (displacement events) in the near surface region was approximately equal for each implant. The ion fluences spanned more than two orders of magnitude, and the resulting damage level at each fluence was monitored by obtaining aligned backscattered (channeling) spectra in a <111> axial direction. As an additional check on the channeling results selected implants were also examined with TEM. The channeling experiments clearly show that the final damage state, at all fluences, for 86Kr and 20Ne is the same. At low fluences, the final damage state for 86Kr, 20Ne, 11B, and 4He appears to be the same, but for high fluences there are unresolved difficulties with the 11B and 4He channeling results.

In-Situ High-Resolution gamma-Spectrometric Survey of Burial Ground-Monitoring Wells.
W. W. Bowman. Sep 81, 40p DP-1598
Contract AC09-76SR00001

In situ high resolution gamma-ray spectrometry with an intrinsic germanium detector assembly of special design surveyed the burial ground monitoring wells to locate and identify gamma emitters that may have migrated from the burial trenches toward the water table.

Gamma-ray spectra were acquired as a function of depth in each well and recorded on magnetic tape. These spectra were reduced by a series of computer programs to produce count rate versus depth profiles for natural and man-made activities. The original spectra and the profiles have been archived on magnetic tape for comparison with similar future surveys. Large amounts of man-made activities were observed in some of the burial trenches; however, below the trench bottoms, only very low but detectable amounts of exp 60 Co and exp 137 Cs were observed in eleven wells. The highest level of man-made gamma activity observed below the trench bottoms has a count rate roughly equal to that observed for uranium daughter activities which are natural to the subsoil. Aerial Radiological Survey of the United States Department of Energy's Pantex Plant and Surrounding Area Amarillo, Texas. Date of Survey: October 1979.
P. K. Boyns. Jul 81, 24p EGG-1183-1768
Contract AC08-76NV01183

An aerial radiological survey was conducted over the United States Department of Energy's Pantex Plant and Pantex Lake areas in October, 1979. The Pantex Plant survey covered an area of approximately 64 km exp 2 . The Pantex Lake survey area was approximately 2 km exp 2 . Both areas were surveyed at an altitude of 46 m (150 feet) with lines spaced at 91 m (300 foot) intervals. Several passes were also made over the shipping areas at the Amarillo International Airport. An array of sodium iodide detectors were mounted in a helicopter to collect gamma ray spectral data. As expected, the spectral data indicated the presence of several areas containing man-made sources. (ERA citation 06:035444)

Annual Environmental Monitoring Report of the Lawrence Berkeley Laboratory, 1979.
G. E. Schleimer. Jun 80, 23p
Contract W-7405-ENG-48

Monitoring data obtained for the calendar year 1979 are described, and general trends are discussed. The following areas are covered: accelerator produced radiation; radionuclide measurements and release (atmospheric, water, and sewer sampling); population dose equivalent resulting from LBL operations; and nonradioactive pollutants. Over the past several years the atmospheric sampling program has, with the exception of occasional known releases, yielded data which are within the range of normal background. The surface water program always yields results within the range of normal background. As no substantial changes in the quantities of radionuclides used are anticipated, no changes are expected in these observations. (ERA citation 05:034138)

See also NUREG/CR-1241-V2.

The Light Water Reactor Pressure Vessel (LWR-PV) Surveillance Dosimetry Improvement Program has been established by NRC in recognition of the importance of improving, maintaining, and standardizing neutron dosimetry, damage correlation, and the associate reactor analysis data and procedures used for predicting the integrated effect of neutron exposure to LWR pressure vessels. A vigorous research effort attacking the same measurement and analysis problems exists worldwide, and strong cooperative links between the USNRC supported activities at HEDL, ORNL, NBS, and NRL and those supported by CEN/SCK (Mol, Belgium), EPRI (Palo Alto, USA), KFA (Julich, Germany), and several UK laboratories have been extended to a number of other countries and laboratories. These cooperative links have been strengthened by the active membership of the scientific staff of many of the participating countries and laboratories in the ASTM E10 Committee on Nuclear Technology and Applications. Several subcommittees of ASTM E10 are responsible for the preparation of LWR-PV surveillance standards.

Uranium and Thorium Series Nuclides in River Sediments and River Water.
M. R. Scott, and P. F Salter. 27p
Contract AS05-76EV03852

Large volume suspended sediment samples were taken from Rio Grande, Mississippi and Suwannee Rivers. These rivers drain arid, moderate and subtropical regions, respectively. The samples were taken to provide enough material to use for chemical fractionation leaching studies of the relationship between Pu and other nuclides with various components of the sediment. This work is still in progress and is described in detail in a separate section of the progress report. (ERA citation 05:032816)

ORO-3852-38 PC **A02**/MF **A01**
Texas A and M Research Foundation, College Station.
Uranium and Thorium Series Isotopes in Nearshore Marine Sediments.
M. R. Scott, and P. F Salter. 11p
Contract AS05-76EV03852

Measurements of U and Th series isotopes have been made on sediments most often as a means of estimating sediment accumulation rates. Therefore data are available for long half-life isotopes such as exp 230 Th and exp 231 Pa on slowly depositing deep-sea sediments, and for the short half-life isotopes such as exp 228 Th, exp 234 Th, and exp 210 Pb mostly on rapidly accumulating coastal sediment. Studies of U and Th series nuclides in sediments of rivers entering the Gulf have been described in a previous section of this progress report. The isotopic decay series are out of equilibrium at several steps in the series. The activity ratio of exp 234 U/ exp 238 U is greater than 1 in sediment and water samples in a few cases, and the exp 230 Th/ exp 234 U ratio is greater than 1 in most instances. In the case of the Mississippi River suspended sediment, an average of 0.93 dpm/gm exp 230 Th is present in excess of the amount of its parent exp 234 U. This excess exp 230 Th clearly must be added to the Gulf of Mexico by the river. The Gulf of Mexico sediments have been reported to have unusually high U concentrations. We have therefore begun a study of U, Th, Pa, Ra, and Pb isotopes in the sediments of this system, including the nearshore marine area of the Mississippi River Delta. The preliminary results are discussed in this report. (ERA citation 05:032817)

Update of Cost Information Contained in a Previous GAO Report on Specific Aspects of the Clinch River Breeder Reactor Project.
26 Jun 81, 21p Rept no. GAO/EMD-81-112

As part of our June 23, 1977, report, the Energy Research and Development Administration (ERDA)--now part of the Department of Energy (DOE)--provided us with some cost and schedule information for the Clinch River Breeder Reactor Project as it related to three different licensing cases. At the time, the administration was attempting to terminate the Clinch River Project. And then, as now, it was a topic of heated debate within the Congress and between the Congress and the executive branch. Consequently, it was against this backdrop that we asked ERDA officials to provide us with specific cost and schedule data for the Clinch River Project, assuming it would be terminated and then restarted about 4 months later, after the Congress had an opportunity to fully consider whether to go ahead with the entire breeder reactor program. At the time, we used the 4-month lapse as an estimate that would provide an indication of the impact the project termination would have on the Clinch River Project's cost and schedule. (Author).
